4.674.4.12 char std::ctype< char >::narrow (char_type *__c*, char *__dfault*) const [inline]

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

This function works as if it returns ctype<char>::do_narrow(c). do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.
__dfault	Char to return if conversion fails.

Returns

The converted character.

Definition at line 923 of file locale_facets.h.

References std::ctype< _CharT >::do_narrow().

4.674.4.13 const char_type∗ std::ctype< char >::narrow (const char_type ∗ __lo, const char_type ∗ __hi, char __dfault, char ∗ __to) const [inline]

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_narrow(lo, hi, dfault, to). do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 956 of file locale_facets.h.

References std::ctype< _CharT >::do_narrow().

4.674.4.14 const char ∗ std::ctype< char >::scan_is (mask __m, const char ∗ __lo, const char ∗ __hi) const [inline]

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char if found, else *__hi*.

Definition at line 57 of file ctype_inline.h.

4.674.4.15 const char ∗ std::ctype< char >::scan_not (mask __m, const char ∗ __lo, const char ∗ __hi) const [inline]

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [__lo,__hi) for which is(m,char) is false.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a non-matching char if found, else *__hi*.

Definition at line 67 of file ctype_inline.h.

4.674.4.16 const mask∗ std::ctype< char >::table ( ) const throw () [inline]

Returns a pointer to the mask table provided to the constructor, or the default from classic_table() if none was provided.

Definition at line 974 of file locale_facets.h.

4.674.4.17 char_type std::ctype< char >::tolower (char_type *__c*) const [inline]

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

tolower() acts as if it returns ctype<char>::do_tolower(__c). do_tolower() must always return the same result for the same input.

Parameters

__c	The char to convert.

Returns

The lowercase char if convertible, else *__c*.

Definition at line 828 of file locale_facets.h.

References std::ctype< _CharT >::do_tolower().

4.674.4.18 const char_type∗ std::ctype< char >::tolower (char_type ∗ *__lo*, const char_type ∗ *__hi*) const [inline]

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

tolower() acts as if it returns ctype<char>:: do_tolower(__lo, __hi). do_tolower() must always return the same result for the same input.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 845 of file locale_facets.h.

References std::ctype< _CharT >::do_tolower().

4.674.4.19 char_type std::ctype< char >::toupper (char_type __c) const [inline]

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

toupper() acts as if it returns ctype<char>::do_toupper(c). do_toupper() must always return the same result for the same input.

Parameters

__c	The char to convert.

Returns

The uppercase char if convertible, else *__c*.

Definition at line 795 of file locale_facets.h.

References std::ctype< _CharT >::do_toupper().

4.674.4.20 const char_type∗ std::ctype< char >::toupper (char_type ∗ __lo, const char_type ∗ __hi) const [inline]

Convert array to uppercase.

This function converts each char in the range [__lo,__hi) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>:: do_toupper(__lo, __hi). do_toupper() must always return the same result for the same input.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 812 of file locale_facets.h.

References std::ctype< _CharT >::do_toupper().

4.674.4.21 char_type std::ctype< char >::widen (char __c) const [inline]

Widen char.

This function converts the char to char_type using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.

Returns

The converted character.

Definition at line 865 of file locale_facets.h.

References std::ctype< _CharT >::do_widen().

4.674.4.22 const char∗ std::ctype< char >::widen (const char ∗ __lo, const char ∗ __hi, char_type ∗ __to) const [inline]

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 892 of file locale_facets.h.

References std::ctype< _CharT >::do_widen().

4.674.5 Member Data Documentation

4.675.1 Detailed Description

template<>class std::ctype< wchar_t >

The ctype<wchar_t> specialization.

This class defines classification and conversion functions for the wchar_t type. It gets used by wchar_t streams for many I/O operations. The wchar_t specialization provides a number of optimizations as well.

ctype<wchar_t> inherits its public methods from __ctype_abstract_base<wchar_t>.

Definition at line 1175 of file locale_facets.h.

4.675.2 Member Typedef Documentation

4.675.2.1 typedef wchar_t std::ctype< wchar_t >::char_type

Typedef for the template parameter wchar_t.

Definition at line 1180 of file locale_facets.h.

4.675.3 Constructor & Destructor Documentation

4.675.3.1 std::ctype< wchar_t >::ctype (size_t *__refs* = 0) [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

4.675.3.2 std::ctype< wchar_t >::ctype (__c_locale *__cloc*, size_t *__refs* = 0) [explicit]

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

Parameters

__cloc	Handle to C locale data.
__refs	Passed to the base facet class.

4.675.3.3 virtual **std::ctype**< wchar_t >::∼**ctype** ( ) [protected], [virtual]

Destructor.

4.675.4 Member Function Documentation

4.675.4.1 virtual bool **std::ctype**< wchar_t >::do_is (mask *__m*, **char_type** *__c*) const [protected], [virtual]

Test wchar_t classification.

This function finds a mask M for *c* and compares it to mask *m*.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__c	The wchar_t to find the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.2 virtual const **char_type**∗ **std::ctype**< wchar_t >::do_is (const **char_type** ∗ *__lo*, const **char_type** ∗ *__hi*, mask ∗ *__vec*) const [protected], [virtual]

Return a mask array.

This function finds the mask for each wchar_t in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.3 virtual char **std::ctype**< wchar_t >::do_narrow (**char_type** *__c*, char *__dfault*) const [protected], [virtual]

Narrow wchar_t to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<wchar_t> facet, *c* will be cast to char and returned.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The wchar_t to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.4 virtual const char_type* std::ctype< wchar_t >::do_narrow (const char_type * *__lo*, const char_type * *__hi*, char *__dfault*, char * *__to*) const [protected], [virtual]

Narrow wchar_t array to char array.

This virtual function converts each wchar_t in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any wchar_t in the input that cannot be converted, *dfault* is used instead. For an underived ctype<wchar_t> facet, the argument will be copied, casting each element to char.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.5 virtual const char_type* std::ctype< wchar_t >::do_scan_is (mask *__m*, const char_type * *__lo*, const char_type * *__hi*) const [protected], [virtual]

Find wchar_t matching mask.

This function searches for and returns the first wchar_t c in [__lo,__hi) for which is(__m,c) is true.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching wchar_t if found, else *__hi*.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.6 virtual const char_type* std::ctype< wchar_t >::do_scan_not (mask *__m*, const char_type * *__lo*, const char_type * *__hi*) const [protected], [virtual]

Find wchar_t not matching mask.

This function searches for and returns a pointer to the first wchar_t c of [__lo,__hi) for which is(__m,c) is false.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a non-matching wchar_t if found, else *__hi*.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.7 virtual char_type std::ctype< wchar_t >::do_tolower (char_type *__c*) const [protected], [virtual]

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__c	The wchar_t to convert.

Returns

The lowercase wchar_t if convertible, else *__c*.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.8 virtual const char_type* std::ctype< wchar_t >::do_tolower (char_type * *__lo*, const char_type * *__hi*) const [protected], [virtual]

Convert array to lowercase.

This virtual function converts each wchar_t in the range [lo,hi) to lowercase if possible. Other elements remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.9 virtual char_type std::ctype< wchar_t >::do_toupper (char_type *__c*) const [protected], [virtual]

Convert to uppercase.

This virtual function converts the wchar_t argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__c	The wchar_t to convert.

Returns

The uppercase wchar_t if convertible, else *__c*.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.10 virtual const char_type* std::ctype< wchar_t >::do_toupper (char_type * *__lo,* const char_type * *__hi*) const [protected], [virtual]

Convert array to uppercase.

This virtual function converts each wchar_t in the range [lo,hi) to uppercase if possible. Other elements remain untouched.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.11 virtual char_type std::ctype< wchar_t >::do_widen (char *__c*) const [protected], [virtual]

Widen char to wchar_t.

This virtual function converts the char to wchar_t using the simplest reasonable transformation. For an underived ctype<wchar_t> facet, the argument will be cast to wchar_t.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.

Returns

The converted wchar_t.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.12 virtual const char∗ **std::ctype**< wchar_t >::do_widen (const char ∗ *__lo,* const char ∗ *__hi,* **char_type** ∗ *__to*) const [protected], [virtual]

Widen char array to wchar_t array.

This function converts each char in the input to wchar_t using the simplest reasonable transformation. For an underived ctype<wchar_t> facet, the argument will be copied, casting each element to wchar_t.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

Implements std::__ctype_abstract_base< wchar_t >.

4.675.4.13 bool **std::__ctype_abstract_base**< wchar_t >::is (mask *__m,* **char_type** *__c*) const [inline], [inherited]

Test char_type classification.

This function finds a mask M for *__c* and compares it to mask *__m*. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__c	The char_type to compare the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Definition at line 162 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_is().

4.675.4.14 const **char_type**∗ **std::__ctype_abstract_base**< wchar_t >::is (const **char_type** ∗ *__lo,* const **char_type** ∗ *__hi,* mask ∗ *__vec*) const [inline], [inherited]

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

Definition at line 179 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_is().

4.675.4.15 char **std::__ctype_abstract_base**< wchar_t >::narrow (**char_type** *__c,* char *__dfault*) const [inline], [inherited]

Narrow char_type to char.

This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_narrow().

4.675.4.16 const **char_type**∗ **std::__ctype_abstract_base**< wchar_t >::narrow (const **char_type** ∗ *__lo,* const **char_type** ∗ *__hi,* char *__dfault,* char ∗ *__to*) const [inline], [inherited]

Narrow array to char array.

This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 346 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_narrow().

4.675.4.17 const **char_type**∗ **std::__ctype_abstract_base**< wchar_t >::scan_is (mask *__m*, const **char_type** ∗ *__lo*, const **char_type** ∗ *__hi*) const [inline], [inherited]

Find char_type matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else *__hi*.

Definition at line 195 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_scan_is().

4.675.4.18 const **char_type**∗ **std::__ctype_abstract_base**< wchar_t >::scan_not (mask *__m*, const **char_type** ∗ *__lo*, const **char_type** ∗ *__hi*) const [inline], [inherited]

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

__m	The mask to compare against.
__lo	Pointer to first char in range.
__hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else *__hi*.

Definition at line 211 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_scan_not().

4.675.4.19 char_type std::__ctype_abstract_base< wchar_t >::tolower (char_type __c) const [inline], [inherited]

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

__c	The char_type to convert.

Returns

The lowercase char_type if convertible, else *__c*.

Definition at line 254 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_tolower().

4.675.4.20 const char_type* std::__ctype_abstract_base< wchar_t >::tolower (char_type * __lo, const char_type * __hi) const [inline], [inherited]

Convert array to lowercase.

This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 269 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_tolower().

4.675.4.21 char_type std::__ctype_abstract_base< wchar_t >::toupper (char_type __c) const [inline], [inherited]

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

__c	The char_type to convert.

Returns

The uppercase char_type if convertible, else *__c*.

Definition at line 225 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_toupper().

4.675.4.22 const char_type* std::__ctype_abstract_base< wchar_t >::toupper (char_type * __lo, const char_type * __hi) const [inline], [inherited]

Convert array to uppercase.

This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 240 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_toupper().

4.675.4.23 char_type std::__ctype_abstract_base< wchar_t >::widen (char __c) const [inline], [inherited]

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_widen().

4.675.4.24 const char* std::__ctype_abstract_base< wchar_t >::widen (const char * __lo, const char * __hi, char_type * __to) const [inline], [inherited]

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 305 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_widen().

4.677.1 Detailed Description

template<typename _CharT>class std::ctype_byname< _CharT >

class ctype_byname [22.2.1.2].

Definition at line 1467 of file locale_facets.h.

4.677.2 Member Function Documentation

4.677.2.1 template<typename _CharT> virtual bool std::ctype< _CharT >::do_is (mask *__m*, char_type *__c*) const [protected], [virtual], [inherited]

Test char_type classification.

This function finds a mask M for *c* and compares it to mask *m*.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__c	The char_type to find the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.2 template<typename _CharT> virtual const char_type* std::ctype< _CharT >::do_is (const char_type * *__lo*, const char_type * *__hi*, mask * *__vec*) const [protected], [virtual], [inherited]

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.3 template<typename _CharT> virtual char **std::ctype**< _CharT >::do_narrow (**char_type** *__c,* char *__dfault*) const `[protected]`, `[virtual]`, `[inherited]`

Narrow char_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Implements std::__ctype_abstract_base< _CharT >.

Referenced by std::ctype< char >::narrow().

4.677.2.4 template<typename _CharT> virtual const **char_type**∗ **std::ctype**< _CharT >::do_narrow (const **char_type** ∗ *__lo,* const **char_type** ∗ *__hi,* char *__dfault,* char ∗ *__to*) const `[protected]`, `[virtual]`, `[inherited]`

Narrow char_type array to char.

This virtual function converts each char_type in the range [__lo,__hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, *__dfault* is used instead.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.5 template<typename _CharT> virtual const char_type∗ std::ctype< _CharT >::do_scan_is (mask __m, const char_type ∗ __lo, const char_type ∗ __hi) const [protected], [virtual], [inherited]

Find char_type matching mask.

This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else *__hi*.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.6 template<typename _CharT> virtual const char_type∗ std::ctype< _CharT >::do_scan_not (mask __m, const char_type ∗ __lo, const char_type ∗ __hi) const [protected], [virtual], [inherited]

Find char_type not matching mask.

This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else *__hi*.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.7 template<typename _CharT> virtual char_type std::ctype< _CharT >::do_tolower (char_type __c) const [protected], [virtual], [inherited]

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__c	The char_type to convert.

Returns

The lowercase char_type if convertible, else *__c*.

Implements std::__ctype_abstract_base< _CharT >.

Referenced by std::ctype< char >::tolower().

4.677.2.8 template<typename _CharT> virtual const **char_type**∗ **std::ctype**< _CharT >::do_tolower (**char_type** ∗ *__lo*, const **char_type** ∗ *__hi*) const [protected], [virtual], [inherited]

Convert array to lowercase.

This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.9 template<typename _CharT> virtual **char_type** **std::ctype**< _CharT >::do_toupper (**char_type** *__c*) const [protected], [virtual], [inherited]

Convert to uppercase.

This virtual function converts the char_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__c	The char_type to convert.

Returns

The uppercase char_type if convertible, else *__c*.

Implements std::__ctype_abstract_base< _CharT >.

Referenced by std::ctype< char >::toupper().

4.677.2.10 template<typename _CharT> virtual const **char_type**∗ **std::ctype**< _CharT >::do_toupper (**char_type** ∗ *__lo*, const **char_type** ∗ *__hi*) const [protected], [virtual], [inherited]

Convert array to uppercase.

This virtual function converts each char_type in the range [__lo,__hi) to uppercase if possible. Other elements remain untouched.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.11 template<typename _CharT> virtual **char_type std::ctype**< _CharT >::do_widen (char *__c*) const [protected], [virtual], [inherited]

Widen char.

This virtual function converts the char to char_type using the simplest reasonable transformation.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.

Returns

The converted char_type

Implements std::__ctype_abstract_base< _CharT >.

Referenced by std::ctype< char >::widen().

4.677.2.12 template<typename _CharT> virtual const char* **std::ctype**< _CharT >::do_widen (const char * *__lo,* const char * *__hi,* **char_type** * *__to*) const [protected], [virtual], [inherited]

Widen char array.

This function converts each char in the input to char_type using the simplest reasonable transformation.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

4.677.2.13 template<typename _CharT> bool std::__ctype_abstract_base< _CharT >::is (mask *__m*, char_type *__c*) const [inline], [inherited]

Test char_type classification.

This function finds a mask M for *__c* and compares it to mask *__m*. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__c	The char_type to compare the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Definition at line 162 of file locale_facets.h.

Referenced by std::basic_istream< _CharT, _Traits >::sentry::sentry().

4.677.2.14 template<typename _CharT> const char_type* std::__ctype_abstract_base< _CharT >::is (const char_type * *__lo*, const char_type * *__hi*, mask * *__vec*) const [inline], [inherited]

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

Definition at line 179 of file locale_facets.h.

4.677.2.15 template<typename _CharT> char std::__ctype_abstract_base< _CharT >::narrow (char_type *__c*, char *__dfault*) const [inline], [inherited]

Narrow char_type to char.

This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file locale_facets.h.

Referenced by std::time_put< _CharT, _OutIter >::put().

4.677.2.16 template<typename _CharT> const char_type∗ std::__ctype_abstract_base< _CharT >::narrow (const char_type ∗ *__lo,* const char_type ∗ *__hi,* char *__dfault,* char ∗ *__to*) const [inline], [inherited]

Narrow array to char array.

This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 346 of file locale_facets.h.

4.677.2.17 template<typename _CharT> const char_type∗ std::__ctype_abstract_base< _CharT >::scan_is (mask *__m,* const char_type ∗ *__lo,* const char_type ∗ *__hi*) const [inline], [inherited]

Find char_type matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else *__hi*.

Definition at line 195 of file locale_facets.h.

4.677.2.18 template<typename _CharT> const char_type∗ std::__ctype_abstract_base< _CharT >::scan_not (mask *__m*, const char_type ∗ *__lo*, const char_type ∗ *__hi*) const [inline], [inherited]

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

__m	The mask to compare against.
__lo	Pointer to first char in range.
__hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else *__hi*.

Definition at line 211 of file locale_facets.h.

4.677.2.19 template<typename _CharT> char_type std::__ctype_abstract_base< _CharT >::tolower (char_type *__c*) const [inline], [inherited]

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

__c	The char_type to convert.

Returns

The lowercase char_type if convertible, else *__c*.

Definition at line 254 of file locale_facets.h.

4.677.2.20 template<typename _CharT> const char_type∗ std::__ctype_abstract_base< _CharT >::tolower (char_type ∗ *__lo*, const char_type ∗ *__hi*) const [inline], [inherited]

Convert array to lowercase.

This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 269 of file locale_facets.h.

4.677.2.21 template<typename _CharT> char_type std::__ctype_abstract_base< _CharT >::toupper (char_type __c) const [inline], [inherited]

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

__c	The char_type to convert.

Returns

The uppercase char_type if convertible, else *__c*.

Definition at line 225 of file locale_facets.h.

4.677.2.22 template<typename _CharT> const char_type* std::__ctype_abstract_base< _CharT >::toupper (char_type * __lo, const char_type * __hi) const [inline], [inherited]

Convert array to uppercase.

This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 240 of file locale_facets.h.

4.677.2.23 template<typename _CharT> char_type std::__ctype_abstract_base< _CharT >::widen (char __c) const [inline], [inherited]

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

Referenced by std::money_get< _CharT, _InIter >::do_get(), std::time_put< _CharT, _OutIter >::do_put(), std::money_put< _CharT, _OutIter >::do_put(), std::tr2::operator<<(), and std::operator<<().

4.677.2.24 template<typename _CharT> const char* **std::__ctype_abstract_base< _CharT >::widen** (const char * *__lo,* const char * *__hi,* **char_type** * *__to*) const [inline], [inherited]

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 305 of file locale_facets.h.

Definition at line 1482 of file locale_facets.h.

4.678.2 Member Typedef Documentation

4.678.2.1 typedef char std::ctype< char >::char_type `[inherited]`

Typedef for the template parameter char.

Definition at line 679 of file locale_facets.h.

4.678.3 Member Function Documentation

4.678.3.1 static const mask* std::ctype< char >::classic_table ( ) throw () `[static]`, `[inherited]`

Returns a pointer to the C locale mask table.

4.678.3.2 virtual char std::ctype< char >::do_narrow (char_type *__c*, char *__dfault*) const `[inline]`, `[protected]`, `[virtual]`, `[inherited]`

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Definition at line 1124 of file locale_facets.h.

4.678.3.3 virtual const char_type* std::ctype< char >::do_narrow (const char_type * *__lo*, const char_type * *__hi*, char *__dfault*, char * *__to*) const `[inline]`, `[protected]`, `[virtual]`, `[inherited]`

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 1150 of file locale_facets.h.

4.678.3.4 virtual char_type std::ctype< char >::do_tolower (char_type *__c*) const [protected], [virtual], [inherited]

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__c	The char to convert.

Returns

The lowercase char if convertible, else *__c*.

4.678.3.5 virtual const char_type* std::ctype< char >::do_tolower (char_type * *__lo,* const char_type * *__hi*) const [protected], [virtual], [inherited]

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.

Returns

__hi.

4.678.3.6 virtual char_type std::ctype< char >::do_toupper (char_type *__c*) const [protected], [virtual], [inherited]

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__c	The char to convert.

Returns

The uppercase char if convertible, else *__c*.

4.678.3.7 virtual const char_type∗ std::ctype< char >::do_toupper (char_type ∗ *__lo*, const char_type ∗ *__hi*) const [protected], [virtual], [inherited]

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

4.678.3.8 virtual char_type std::ctype< char >::do_widen (char *__c*) const [inline], [protected], [virtual], [inherited]

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.

Returns

The converted character.

Definition at line 1075 of file locale_facets.h.

4.678.3.9 virtual const char∗ std::ctype< char >::do_widen (const char ∗ __lo, const char ∗ __hi, char_type ∗ __to) const [inline], [protected], [virtual], [inherited]

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 1098 of file locale_facets.h.

4.678.3.10 bool std::ctype< char >::is (mask __m, char __c) const [inline], [inherited]

Test char classification.

This function compares the mask table[c] to *__m*.

Parameters

__c	The char to compare the mask of.
__m	The mask to compare against.

Returns

True if __m & table[__c] is true, false otherwise.

Definition at line 43 of file ctype_inline.h.

4.678.3.11 const char ∗ std::ctype< char >::is (const char ∗ __lo, const char ∗ __hi, mask ∗ __vec) const [inline], [inherited]

Return a mask array.

This function finds the mask for each char in the range [lo, hi) and successively writes it to vec. vec must have as many elements as the char array.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

Definition at line 48 of file ctype_inline.h.

4.678.3.12 char std::ctype< char >::narrow (char_type *__c*, char *__dfault*) const [inline], [inherited]

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

This function works as if it returns ctype<char>::do_narrow(c). do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.
__dfault	Char to return if conversion fails.

Returns

The converted character.

Definition at line 923 of file locale_facets.h.

References std::ctype< _CharT >::do_narrow().

4.678.3.13 const char_type∗ std::ctype< char >::narrow (const char_type ∗ *__lo*, const char_type ∗ *__hi*, char *__dfault*, char ∗ *__to*) const [inline], [inherited]

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_narrow(lo, hi, dfault, to). do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 956 of file locale_facets.h.

References std::ctype< _CharT >::do_narrow().

4.678.3.14 const char * **std::ctype**< char >::scan_is (mask *__m*, const char * *__lo*, const char * *__hi*) const [inline], [inherited]

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char if found, else *__hi*.

Definition at line 57 of file ctype_inline.h.

4.678.3.15 const char * **std::ctype**< char >::scan_not (mask *__m*, const char * *__lo*, const char * *__hi*) const [inline], [inherited]

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [__lo,__hi) for which is(m,char) is false.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a non-matching char if found, else *__hi*.

Definition at line 67 of file ctype_inline.h.

4.678.3.16 const mask* **std::ctype**< char >::table ( ) const throw () [inline], [inherited]

Returns a pointer to the mask table provided to the constructor, or the default from classic_table() if none was provided.

Definition at line 974 of file locale_facets.h.

4.678.3.17 char_type **std::ctype**< char >::tolower (char_type *__c*) const [inline], [inherited]

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

tolower() acts as if it returns ctype<char>::do_tolower(__c). do_tolower() must always return the same result for the same input.

Parameters

__c	The char to convert.

Returns

The lowercase char if convertible, else *__c*.

Definition at line 828 of file locale_facets.h.

References std::ctype< _CharT >::do_tolower().

4.678.3.18 const char_type∗ std::ctype< char >::tolower (char_type ∗ *__lo,* const char_type ∗ *__hi*) const [inline], [inherited]

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

tolower() acts as if it returns ctype<char>:: do_tolower(__lo, __hi). do_tolower() must always return the same result for the same input.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 845 of file locale_facets.h.

References std::ctype< _CharT >::do_tolower().

4.678.3.19 char_type std::ctype< char >::toupper (char_type *__c*) const [inline], [inherited]

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

toupper() acts as if it returns ctype<char>::do_toupper(c). do_toupper() must always return the same result for the same input.

Parameters

__c	The char to convert.

Returns

The uppercase char if convertible, else *__c*.

Definition at line 795 of file locale_facets.h.

References std::ctype< _CharT >::do_toupper().

4.678.3.20 const char_type∗ std::ctype< char >::toupper (char_type ∗ *__lo,* const char_type ∗ *__hi*) const [inline], [inherited]

Convert array to uppercase.

This function converts each char in the range [__lo,__hi) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>:: do_toupper(__lo, __hi). do_toupper() must always return the same result for the same input.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.

Returns

__hi.

Definition at line 812 of file locale_facets.h.

References std::ctype< _CharT >::do_toupper().

4.678.3.21 char_type std::ctype< char >::widen (char *__c*) const [inline], [inherited]

Widen char.

This function converts the char to char_type using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.

Returns

The converted character.

Definition at line 865 of file locale_facets.h.

References std::ctype< _CharT >::do_widen().

4.678.3.22 const char* std::ctype< char >::widen (const char * *__lo,* const char * *__hi,* char_type * *__to*) const [inline], [inherited]

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 892 of file locale_facets.h.

References std::ctype< _CharT >::do_widen().

4.678.4 Member Data Documentation

4.678.4.1 locale::id std::ctype< char >::id [static], [inherited]

The facet id for ctype<char>

Definition at line 696 of file locale_facets.h.

4.678.4.2 const size_t std::ctype< char >::table_size [static], [inherited]

The size of the mask table. It is SCHAR_MAX + 1.

Definition at line 698 of file locale_facets.h.

4.686.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>class std::deque< _Tp, _Alloc >

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `reversible container`, and a `sequence`, including the `optional sequence requirements`.

In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.

Here's how a deque<Tp> manages memory. Each deque has 4 members:

- Tp** _M_map

- size_t _M_map_size

- iterator _M_start, _M_finish

map_size is at least 8. map is an array of map_size pointers-to-*nodes*. (The name map has nothing to do with the std::map class, and **nodes** should not be confused with std::list's usage of *node*.)

A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-Tp. If Tp is very large, there will be one Tp element per node (i.e., an *array* of one). For non-huge Tp's, node size is inversely related to Tp size: the larger the Tp, the fewer Tp's will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different Tp's, to improve allocator efficiency.

Not every pointer in the map array will point to a node. If the initial number of elements in the deque is small, the /middle/ map pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the map grows: available map pointers, if any, will be on the ends. As new nodes are created, only a subset of the map's pointers need to be copied *outward*.

Class invariants:

- For any nonsingular iterator i:
  - i.node points to a member of the map array. (Yes, you read that correctly: i.node does not actually point to a node.) The member of the map array is what actually points to the node.
  - i.first == ∗(i.node) (This points to the node (first Tp element).)
  - i.last == i.first + node_size
  - i.cur is a pointer in the range [i.first, i.last). NOTE: the implication of this is that i.cur is always a dereferenceable pointer, even if i is a past-the-end iterator.
- Start and Finish are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with <N elements (where N is the node buffer size) must have one node, a deque with N through (2N-1) elements must have two nodes, etc.
- For every node other than start.node and finish.node, every element in the node is an initialized object. If start.node == finish.node, then [start.cur, finish.cur) are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, [start.cur, start.last) and [finish.first, finish.cur) are initialized objects, and [start.first, start.cur) and [finish.cur, finish.last) are uninitialized storage.
- [map, map + map_size) is a valid, non-empty range.
- [start.node, finish.node] is a valid range contained within [map, map + map_size).
- A pointer in the range [map, map + map_size) points to an allocated node if and only if the pointer is in the range [start.node, finish.node].

  Here's the magic: nothing in deque is **aware** of the discontiguous storage!

  The memory setup and layout occurs in the parent, _Base, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the start and finish iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

4.686.2 Constructor & Destructor Documentation

4.686.2.1 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> **std::deque< _Tp, _Alloc >::deque ( )** `[inline]`

Default constructor creates no elements.

Definition at line 782 of file stl_deque.h.

4.686.2.2 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> **std::deque< _Tp, _Alloc >::deque (const allocator_type & *__a*)** `[inline]`, `[explicit]`

Creates a deque with no elements.

Parameters

__a	An allocator object.

Definition at line 790 of file stl_deque.h.

4.686.2.3 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (size_type __n) [inline], [explicit]

Creates a deque with default constructed elements.

Parameters

__n	The number of elements to initially create.

This constructor fills the deque with *n* default constructed elements.

Definition at line 802 of file stl_deque.h.

4.686.2.4 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (size_type __n, const value_type & __value, const allocator_type & __a = allocator_type()) [inline]

Creates a deque with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator.

This constructor fills the deque with *__n* copies of *__value*.

Definition at line 814 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_fill_initialize().

4.686.2.5 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (const deque< _Tp, _Alloc > & __x) [inline]

Deque copy constructor.

Parameters

__x	A deque of identical element and allocator types.

The newly-created deque uses a copy of the allocation object used by *__x*.

Definition at line 841 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::begin(), and std::deque< _Tp, _Alloc >::end().

4.686.2.6 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (deque< _Tp, _Alloc > && __x) [inline]

Deque move constructor.

Parameters

__x	A deque of identical element and allocator types.

The newly-created deque contains the exact contents of *__x*. The contents of *__x* are a valid, but unspecified deque.

Definition at line 855 of file stl_deque.h.

4.686.2.7 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (initializer_list< value_type > __l, const allocator_type & __a = allocator_type()) [inline]

Builds a deque from an initializer list.

Parameters

__l	An initializer_list.
__a	An allocator object.

Create a deque consisting of copies of the elements in the initializer_list *__l*.

This will call the element type's copy constructor N times (where N is __l.size()) and do no memory reallocation.

Definition at line 869 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_range_initialize().

4.686.2.8 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> std::deque< _Tp, _Alloc >::deque (_InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type()) [inline]

Builds a deque from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__a	An allocator object.

Create a deque consisting of copies of the elements from [__first, __last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(__first,__last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

Definition at line 896 of file stl_deque.h.

4.686.2.9 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::~deque ( ) [inline], [noexcept]

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 917 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::begin(), and std::deque< _Tp, _Alloc >::end().

4.686.3 Member Function Documentation

4.686.3.1 template<typename _Tp , typename _Alloc > void deque::_M_fill_initialize (const value_type & __value) [protected]

Fills the deque with copies of value.

Parameters

__value	Initial value.

Returns

Nothing.

Precondition

_M_start and _M_finish have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).

Definition at line 351 of file deque.tcc.

References std::_Destroy().

Referenced by std::deque< _Tp, _Alloc >::deque().

4.686.3.2 template<typename _Tp , typename _Alloc > void std::_Deque_base< _Tp, _Alloc >::_M_initialize_map (size_t *__num_elements*) [protected], [inherited]

Layout storage.

Parameters

__num_elements	The count of T's for which to allocate space at first.

Returns

Nothing.

The initial underlying memory layout is a bit complicated...

Definition at line 582 of file stl_deque.h.

References std::max().

4.686.3.3 template<typename _Tp , typename _Alloc > void deque::_M_new_elements_at_back (size_type *__new_elements*) [protected]

Memory-handling helpers for the previous internal insert functions.

Definition at line 845 of file deque.tcc.

References std::size().

Referenced by std::deque< _Tp, _Alloc >::_M_reserve_elements_at_back().

4.686.3.4 template<typename _Tp , typename _Alloc > void deque::_M_new_elements_at_front (size_type *__new_elements*) [protected]

Memory-handling helpers for the previous internal insert functions.

Definition at line 820 of file deque.tcc.

References std::size().

Referenced by std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front().

4.686.3.5 template<typename _Tp , typename _Alloc > void deque::_M_pop_back_aux ( ) [protected]

Helper functions for push_∗ and pop_∗.

Definition at line 501 of file deque.tcc.

Referenced by std::deque< _Tp, _Alloc >::pop_back().

4.686.3.6 template<typename _Tp , typename _Alloc > void deque::_M_pop_front_aux ( ) [protected]

Helper functions for push_∗ and pop_∗.

Definition at line 516 of file deque.tcc.

Referenced by std::deque< _Tp, _Alloc >::pop_front().

4.686.3.7 template<typename _Tp , typename _Alloc > template<typename... _Args> void deque::_M_push_back_aux (_Args &&... *__args*) [protected]

Helper functions for push_∗ and pop_∗.

Definition at line 435 of file deque.tcc.

Referenced by std::deque< _Tp, _Alloc >::push_back().

4.686.3.8 template<typename _Tp , typename _Alloc > template<typename... _Args> void deque::_M_push_front_aux (_Args &&... *__args*) [protected]

Helper functions for push_∗ and pop_∗.

Definition at line 469 of file deque.tcc.

Referenced by std::deque< _Tp, _Alloc >::push_front().

4.686.3.9 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_range_check (size_type *__n*) const [inline], [protected]

Safety check used only from at().

Definition at line 1265 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::size().

Referenced by std::deque< _Tp, _Alloc >::at().

4.686.3.10 template<typename _Tp , typename _Alloc > template<typename _InputIterator > void deque::_M_range_initialize (_InputIterator *__first,* _InputIterator *__last,* std::input_iterator_tag) [protected]

Fills the deque with whatever is in [first,last).

Parameters

__first	An input iterator.
__last	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using push_back on each value from the iterator.

Definition at line 377 of file deque.tcc.

Referenced by std::deque< _Tp, _Alloc >::deque().

4.686.3.11 template<typename _Tp , typename _Alloc > template<typename _ForwardIterator > void deque::_M_range_initialize (_ForwardIterator *__first*, _ForwardIterator *__last*, std::forward_iterator_tag) [protected]

Fills the deque with whatever is in [first,last).

Parameters

__first	An input iterator.
__last	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using push_back on each value from the iterator.

Definition at line 397 of file deque.tcc.

References std::_Destroy(), std::advance(), and std::distance().

4.686.3.12 template<typename _Tp , typename _Alloc > void deque::_M_reallocate_map (size_type *__nodes_to_add*, bool *__add_at_front*) [protected]

Memory-handling helpers for the major map.

Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)

Definition at line 870 of file deque.tcc.

References std::max().

Referenced by std::deque< _Tp, _Alloc >::_M_reserve_map_at_back(), and std::deque< _Tp, _Alloc >::_M_reserve_map_at_front().

4.686.3.13 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_back (size_type *__n*) [inline], [protected]

Memory-handling helpers for the previous internal insert functions.

Definition at line 1898 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_new_elements_at_back().

4.686.3.14 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front (size_type *__n*) [inline], [protected]

Memory-handling helpers for the previous internal insert functions.

Definition at line 1888 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_new_elements_at_front().

4.686.3.15 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_reserve_map_at_back (size_type *__nodes_to_add* = 1) [inline], [protected]

Memory-handling helpers for the major map.

Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)

Definition at line 1924 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_reallocate_map().

4.686.3.16 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_reserve_map_at_front (size_type *__nodes_to_add* = 1) [inline], [protected]

Memory-handling helpers for the major map.

Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)

Definition at line 1932 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_reallocate_map().

4.686.3.17 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::assign (size_type *__n*, const value_type & *__val*) [inline]

Assigns a given value to a deque.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a deque with *n* copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 978 of file stl_deque.h.

Referenced by std::deque< _Tp, _Alloc >::operator=().

4.686.3.18 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void std::deque< _Tp, _Alloc >::assign (_InputIterator *__first*, _InputIterator *__last*) [inline]

Assigns a range to a deque.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a deque with copies of the elements in the range [__first,__last).

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 997 of file stl_deque.h.

4.686.3.19 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::assign (initializer_list< value_type > *__l*) [inline]

Assigns an initializer list to a deque.

Parameters

__l	An initializer_list.

This function fills a deque with copies of the elements in the initializer_list *__l*.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 1022 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::assign().

Referenced by std::deque< _Tp, _Alloc >::assign().

4.686.3.20 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque< _Tp, _Alloc >::at (size_type *__n*) [inline]

Provides access to the data contained in the deque.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

Exceptions

std::out_of_range	If *__n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws out_of_range if the check fails.

Definition at line 1284 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_range_check().

4.686.3.21 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque< _Tp, _Alloc >::at (size_type *__n*) const [inline]

Provides access to the data contained in the deque.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

Exceptions

std::out_of_range	If *__n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws out_of_range if the check fails.

Definition at line 1302 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_range_check().

4.686.3.22 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque< _Tp, _Alloc >::back ( ) [inline]

Returns a read/write reference to the data at the last element of the deque.

Definition at line 1329 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::end().

4.686.3.23 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque< _Tp, _Alloc >::back ( ) const [inline]

Returns a read-only (constant) reference to the data at the last element of the deque.

Definition at line 1341 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::end().

4.686.3.24 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1037 of file stl_deque.h.

Referenced by std::deque< _Tp, _Alloc >::clear(), std::deque< _Tp, _Alloc >::deque(), std::deque< _Tp, _Alloc >::front(), std::deque< _Tp, _Alloc >::operator=(), std::operator==(), and std::deque< _Tp, _Alloc >::~deque().

4.686.3.25 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1045 of file stl_deque.h.

4.686.3.26 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1108 of file stl_deque.h.

4.686.3.27 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1117 of file stl_deque.h.

4.686.3.28 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::clear ( ) [inline], [noexcept]

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1616 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::begin().

Referenced by std::deque< _Tp, _Alloc >::operator=().

4.686.3.29 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::crbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1126 of file stl_deque.h.

4.686.3.30 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::crend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1135 of file stl_deque.h.

4.686.3.31 template<typename _Tp , typename _Alloc > template<typename... _Args> deque< _Tp, _Alloc >::iterator deque::emplace (iterator *__position*, _Args &&... *__args*)

Inserts an object in deque before specified iterator.

Parameters

__position	An iterator into the deque.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location.

Definition at line 172 of file deque.tcc.

Referenced by std::deque< _Tp, _Alloc >::insert().

4.686.3.32 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::deque< _Tp, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the deque is empty. (Thus begin() would equal end().)

Definition at line 1228 of file stl_deque.h.

4.686.3.33 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::end ( ) [inline], [noexcept]

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1054 of file stl_deque.h.

Referenced by std::deque< _Tp, _Alloc >::back(), std::deque< _Tp, _Alloc >::deque(), std::deque< _Tp, _Alloc >::operator=(), std::operator==(), and std::deque< _Tp, _Alloc >::∼deque().

4.686.3.34 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque< _Tp, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1063 of file stl_deque.h.

4.686.3.35 template<typename _Tp , typename _Alloc > deque< _Tp, _Alloc >::iterator deque::erase (iterator *__position*)

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 194 of file deque.tcc.

References std::begin(), std::end(), and std::size().

4.686.3.36 template<typename _Tp , typename _Alloc > deque< _Tp, _Alloc >::iterator deque::erase (iterator *__first,* iterator *__last*)

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [__first,__last) and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 217 of file deque.tcc.

References std::begin(), std::end(), and std::size().

4.686.3.37 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque< _Tp, _Alloc >::front ( ) [inline]

Returns a read/write reference to the data at the first element of the deque.

Definition at line 1313 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::begin().

4.686.3.38 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque< _Tp, _Alloc >::front ( ) const [inline]

Returns a read-only (constant) reference to the data at the first element of the deque.

Definition at line 1321 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::begin().

4.686.3.39 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::deque< _Tp, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Get a copy of the memory allocation object.

Definition at line 1028 of file stl_deque.h.

4.686.3.40 template<typename _Tp , typename _Alloc > deque< _Tp, _Alloc >::iterator deque::insert (iterator *__position*, const value_type & *__x*)

Inserts given value into deque before specified iterator.

Parameters

__position	An iterator into the deque.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

Definition at line 149 of file deque.tcc.

Referenced by std::deque< _Tp, _Alloc >::resize().

4.686.3.41 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::insert (iterator *__position*, value_type && *__x*) [inline]

Inserts given rvalue into deque before specified iterator.

Parameters

__position	An iterator into the deque.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

Definition at line 1492 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::emplace().

4.686.3.42 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::insert (iterator *__p*, initializer_list< value_type > *__l*) [inline]

Inserts an initializer list into the deque.

Parameters

__p	An iterator into the deque.
__l	An initializer_list.

This function will insert copies of the data in the initializer_list *__l* into the deque before the location specified by *__p*. This is known as *list insert*.

Definition at line 1505 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::insert().

Referenced by std::deque< _Tp, _Alloc >::insert().

4.686.3.43 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::insert (iterator *__position,* size_type *__n,* const value_type & *__x*) [inline]

Inserts a number of copies of given data into the deque.

Parameters

__position	An iterator into the deque.
__n	Number of elements to be inserted.
__x	Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *__position*.

Definition at line 1519 of file stl_deque.h.

4.686.3.44 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void std::deque< _Tp, _Alloc >::insert (iterator *__position,* _InputIterator *__first,* _InputIterator *__last*) [inline]

Inserts a range into the deque.

Parameters

__position	An iterator into the deque.
__first	An input iterator.
__last	An input iterator.

This function will insert copies of the data in the range [__first,__last) into the deque before the location specified by *__position*. This is known as *range insert*.

Definition at line 1536 of file stl_deque.h.

4.686.3.45 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::deque< _Tp, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the size() of the largest possible deque.

Definition at line 1147 of file stl_deque.h.

4.686.3.46 template<typename _Tp , typename _Alloc > deque< _Tp, _Alloc > & deque::operator= (const deque< _Tp, _Alloc > & *__x*)

Deque assignment operator.

Parameters

__x	A deque of identical element and allocator types.

All the elements of *x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 93 of file deque.tcc.

References std::deque< _Tp, _Alloc >::begin(), std::deque< _Tp, _Alloc >::end(), std::deque< _Tp, _Alloc >::size(), and std::size().

4.686.3.47 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque< _Tp, _Alloc >::operator= (deque< _Tp, _Alloc > && *__x*) [inline]

Deque move assignment operator.

Parameters

__x	A deque of identical element and allocator types.

The contents of *__x* are moved into this deque (without copying). *__x* is a valid, but unspecified deque.

Definition at line 939 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::clear(), and std::deque< _Tp, _Alloc >::swap().

4.686.3.48 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque< _Tp, _Alloc >::operator= (initializer_list< value_type > *__l*) [inline]

Assigns an initializer list to a deque.

Parameters

__l	An initializer_list.

This function fills a deque with copies of the elements in the initializer_list *__l*.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 960 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::assign().

4.686.3.49 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque< _Tp, _Alloc >::operator[] (size_type *__n*) [inline]

Subscript access to the data contained in the deque.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

Definition at line 1244 of file stl_deque.h.

4.686.3.50 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque< _Tp, _Alloc >::operator[] (size_type __n) const [inline]

Subscript access to the data contained in the deque.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

Definition at line 1259 of file stl_deque.h.

4.686.3.51 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::pop_back ( ) [inline]

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

Definition at line 1442 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_pop_back_aux().

4.686.3.52 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::pop_front ( ) [inline]

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.

Definition at line 1421 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_pop_front_aux().

4.686.3.53 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::push_back (const value_type & __x) [inline]

Add data to the end of the deque.

Parameters

__x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1390 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_push_back_aux().

4.686.3.54 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::push_front (const value_type & __x) [inline]

Add data to the front of the deque.

Parameters

__x	Data to be added.

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1359 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_push_front_aux().

4.686.3.55 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque< _Tp, _Alloc >::rbegin ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1072 of file stl_deque.h.

4.686.3.56 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1081 of file stl_deque.h.

4.686.3.57 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque< _Tp, _Alloc >::rend ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1090 of file stl_deque.h.

4.686.3.58 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1099 of file stl_deque.h.

4.686.3.59 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::resize (size_type __new_size) [inline]

Resizes the deque to the specified number of elements.

Parameters

__new_size	Number of elements the deque should contain.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

Definition at line 1161 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::size().

4.686.3.60 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void **std::deque**< _Tp, _Alloc >::resize (size_type *__new_size,* const value_type & *__x*) [inline]

Resizes the deque to the specified number of elements.

Parameters

__new_size	Number of elements the deque should contain.
__x	Data with which new elements should be populated.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

Definition at line 1183 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::insert(), and std::deque< _Tp, _Alloc >::size().

4.686.3.61 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void **std::deque**< _Tp, _Alloc >::shrink_to_fit ( ) [inline]

A non-binding request to reduce memory use.

Definition at line 1219 of file stl_deque.h.

4.686.3.62 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type **std::deque**< _Tp, _Alloc >::size ( ) const [inline], [noexcept]

Returns the number of elements in the deque.

Definition at line 1142 of file stl_deque.h.

Referenced by std::deque< _Tp, _Alloc >::_M_range_check(), std::deque< _Tp, _Alloc >::operator=(), std::operator==(), and std::deque< _Tp, _Alloc >::resize().

4.686.3.63 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void **std::deque**< _Tp, _Alloc >::swap (**deque**< _Tp, _Alloc > & *__x*) [inline]

Swaps data with another deque.

Parameters

__x	A deque of the same element and allocator types.

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(d1,d2) will feed to this function.

Definition at line 1596 of file stl_deque.h.

Referenced by std::deque< _Tp, _Alloc >::operator=(), and std::swap().

4.687.1 Detailed Description

template<typename _RandomNumberEngine, size_t __p, size_t __r>class std::discard_block_engine< _RandomNumberEngine, __p, __r >

Produces random numbers from some base engine by discarding blocks of data.

0 <= `__r` <= `__p`

Definition at line 854 of file random.h.

4.687.2 Member Typedef Documentation

4.687.2.1 template<typename _RandomNumberEngine, size_t __p, size_t __r> typedef _RandomNumberEngine::result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::result_type

The type of the generated random value.

Definition at line 857 of file random.h.

4.687.3 Constructor & Destructor Documentation

4.687.3.1 template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine ( ) `[inline]`

Constructs a default discard_block_engine engine.

The underlying engine is default constructed as well.

Definition at line 872 of file random.h.

4.687.3.2 template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (const _RandomNumberEngine & *__rng*) `[inline]`, `[explicit]`

Copy constructs a discard_block_engine engine.

Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 882 of file random.h.

4.687.3.3 template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (_RandomNumberEngine && *__rng*) `[inline]`, `[explicit]`

Move constructs a discard_block_engine engine.

Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 892 of file random.h.

4.687.3.4 template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (result_type __s) [inline], [explicit]

Seed constructs a discard_block_engine engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

__s	A seed value for the base class engine.

Definition at line 902 of file random.h.

4.687.3.5 template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _Sseq , typename = typename std::enable_if<!std::is_same<_Sseq, discard_block_engine>::value && !std::is_same<_Sseq, _RandomNumberEngine>::value> ::type> std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (_Sseq & __q) [inline], [explicit]

Generator construct a discard_block_engine engine.

Parameters

__q	A seed sequence.

Definition at line 915 of file random.h.

4.687.4 Member Function Documentation

4.687.4.1 template<typename _RandomNumberEngine, size_t __p, size_t __r> const _RandomNumberEngine& std::discard_block_engine< _RandomNumberEngine, __p, __r >::base ( ) const [inline], [noexcept]

Gets a const reference to the underlying generator engine object.

Definition at line 959 of file random.h.

4.687.4.2 template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard (unsigned long long __z) [inline]

Discard a sequence of random numbers.

Definition at line 980 of file random.h.

4.687.4.3 template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::max ( ) [inline], [static]

Gets the maximum value in the generated random number range.

Definition at line 973 of file random.h.

References std::max().

4.687.4.4 template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::min ( ) [inline], [static]

Gets the minimum value in the generated random number range.

Definition at line 966 of file random.h.

References std::min().

4.687.4.5 template<typename _RandomNumberEngine , size_t __p, size_t __r> discard_block_engine< _RandomNumberEngine, __p, __r >::result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::operator() ( )

Gets the next value in the generated random number sequence.

Definition at line 688 of file bits/random.tcc.

4.687.4.6 template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed ( ) `[inline]`

Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

Definition at line 924 of file random.h.

4.687.4.7 template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed (result_type *__s*) `[inline]`

Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

Definition at line 935 of file random.h.

4.687.4.8 template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _Sseq > void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed (_Sseq & *__q*) `[inline]`

Reseeds the discard_block_engine object with the given seed sequence.

Parameters

__q	A seed generator function.

Definition at line 948 of file random.h.

4.687.5 Friends And Related Function Documentation

4.687.5.1 template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _RandomNumberEngine1 , size_t __p1, size_t __r1, typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & *__os*, const std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & *__x*) `[friend]`

Inserts the current state of a discard_block_engine random number generator engine ___`x` into the output stream ___`os`.

Parameters

__os	An output stream.
__x	A discard_block_engine random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.687.5.2 template<typename _RandomNumberEngine, size_t __p, size_t __r> bool operator== (const discard_block_engine< _RandomNumberEngine, __p, __r > & *__lhs*, const discard_block_engine< _RandomNumberEngine, __p, __r > & *__rhs*) [friend]

Compares two discard_block_engine random number generator objects of the same type for equality.

Parameters

__lhs	A discard_block_engine random number generator object.
__rhs	Another discard_block_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1004 of file random.h.

4.687.5.3 template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _RandomNumberEngine1 , size_t __p1, size_t __r1, typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & *__is*, std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & *__x*) [friend]

Extracts the current state of a % subtract_with_carry_engine random number generator engine `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A discard_block_engine random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

4.688.1 Detailed Description

template<typename _IntType = int>class std::discrete_distribution< _IntType >

A discrete_distribution random number distribution.

The formula for the discrete probability mass function is

Definition at line 5250 of file random.h.

4.688.2 Member Typedef Documentation

4.688.2.1 template<typename _IntType = int> typedef _IntType **std::discrete_distribution**< _IntType >::**result_type**

The type of the range of the distribution.

Definition at line 5253 of file random.h.

4.688.3 Member Function Documentation

4.688.3.1 template<typename _IntType = int> **result_type std::discrete_distribution**< _IntType >::max ( ) const `[inline]`

Returns the least upper bound value of the distribution.

Definition at line 5370 of file random.h.

References std::vector< _Tp, _Alloc >::empty(), and std::vector< _Tp, _Alloc >::size().

4.688.3.2 template<typename _IntType = int> **result_type std::discrete_distribution**< _IntType >::min ( ) const `[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 5363 of file random.h.

4.688.3.3 template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > **result_type std::discrete_distribution**< _IntType >::operator() (_UniformRandomNumberGenerator & *__urng*) `[inline]`

Generating functions.

Definition at line 5381 of file random.h.

References std::discrete_distribution< _IntType >::operator()().

Referenced by std::discrete_distribution< _IntType >::operator()().

4.688.3.4 template<typename _IntType = int> **param_type std::discrete_distribution**< _IntType >::param ( ) const `[inline]`

Returns the parameter set of the distribution.

Definition at line 5348 of file random.h.

4.688.3.5 template<typename _IntType = int> void **std::discrete_distribution**< _IntType >::param (const **param_type** & *__param*) `[inline]`

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 5356 of file random.h.

4.688.3.6 template<typename _IntType = int> **std::vector**<double> **std::discrete_distribution**< _IntType >::probabilities ( ) const `[inline]`

Returns the probabilities of the distribution.

Definition at line 5338 of file random.h.

References std::vector< _Tp, _Alloc >::empty().

4.688.3.7 template<typename _IntType = int> void **std::discrete_distribution**< _IntType >::reset ( ) `[inline]`

Resets the distribution state.

Definition at line 5331 of file random.h.

4.688.4 Friends And Related Function Documentation

4.688.4.1 template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > **std::basic_ostream**<_CharT, _Traits>& operator<< (**std::basic_ostream**< _CharT, _Traits > & *__os,* const **std::discrete_distribution**< _IntType1 > & *__x*) `[friend]`

Inserts a discrete_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A discrete_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.688.4.2 template<typename _IntType = int> bool operator== (const **discrete_distribution**< _IntType > & *__d1,* const **discrete_distribution**< _IntType > & *__d2*) `[friend]`

Return true if two discrete distributions have the same parameters.

Definition at line 5416 of file random.h.

4.688.4.3 template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > **std::basic_istream**<_CharT, _Traits>& operator>> (**std::basic_istream**< _CharT, _Traits > & *__is,* **std::discrete_distribution**< _IntType1 > & *__x*) `[friend]`

Extracts a discrete_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A discrete_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

- random.h
- bits/random.tcc

4.689 std::discrete_distribution< _IntType >::param_type Struct Reference

Public Types

- typedef discrete_distribution< _IntType > **distribution_type**

Public Member Functions

Friends

- class **discrete_distribution< _IntType >**
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.689.1 Detailed Description

template<typename _IntType = int>struct std::discrete_distribution< _IntType >::param_type

Parameter type.

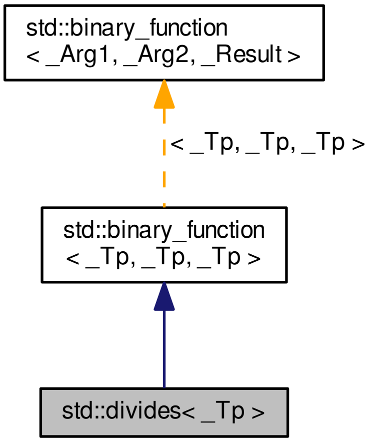
Definition at line 5259 of file random.h.

The documentation for this struct was generated from the following files:

- random.h
- bits/random.tcc

4.690 std::divides< _Tp > Struct Template Reference

Inheritance diagram for std::divides< _Tp >:



Public Types

- typedef _Tp first_argument_type
- typedef _Tp result_type
- typedef _Tp second_argument_type

Public Member Functions

- _Tp **operator()** (const _Tp &__x, const _Tp &__y) const

4.690.1 Detailed Description

template<typename _Tp>struct std::divides< _Tp >

One of the math functors.

Definition at line 167 of file stl_function.h.

4.690.2 Member Typedef Documentation

4.690.2.1 typedef _Tp std::binary_function< _Tp , _Tp , _Tp >::first_argument_type `[inherited]`

`first_argument_type` is the type of the first argument

Definition at line 117 of file stl_function.h.

4.690.2.2 typedef _Tp **std::binary_function**< _Tp , _Tp , _Tp >**::result_type** `[inherited]`

`result_type` is the return type

Definition at line 123 of file stl_function.h.

4.690.2.3 typedef _Tp **std::binary_function**< _Tp , _Tp , _Tp >**::second_argument_type** `[inherited]`

`second_argument_type` is the type of the second argument

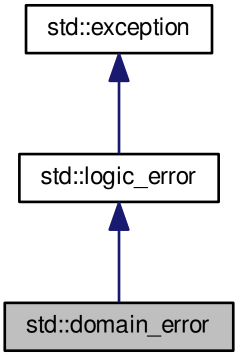
Definition at line 120 of file stl_function.h.

The documentation for this struct was generated from the following file:

- stl_function.h

4.691 std::domain_error Class Reference

Inheritance diagram for std::domain_error:



Public Member Functions

- **domain_error** (const string &__arg)
- virtual const char * what () const noexcept

4.691.1 Detailed Description

Thrown by the library, or by you, to report domain errors (domain in the mathematical sense).

Definition at line 74 of file stdexcept.

4.691.2 Member Function Documentation

4.691.2.1 virtual const char∗ std::logic_error::what ( ) const [virtual], [noexcept], [inherited]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.

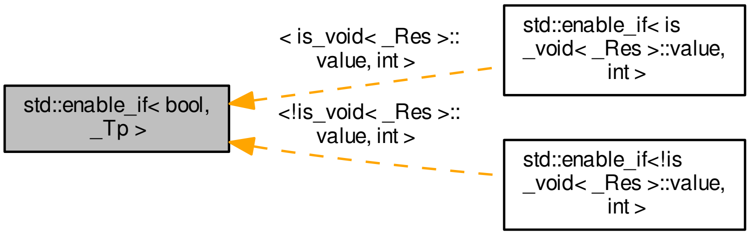
Reimplemented in std::future_error.

The documentation for this class was generated from the following file:

- stdexcept

4.692 std::enable_if< bool, _Tp > Struct Template Reference

Inheritance diagram for std::enable_if< bool, _Tp >:



4.692.1 Detailed Description

template<bool, typename _Tp = void>struct std::enable_if< bool, _Tp >

Define a member typedef `type` only if a boolean constant is true.

Definition at line 1766 of file type_traits.

The documentation for this struct was generated from the following file:

- type_traits

4.693 std::enable_shared_from_this< _Tp > Class Template Reference

Public Member Functions

- shared_ptr< _Tp > **shared_from_this** ()
- shared_ptr< const _Tp > **shared_from_this** () const

Protected Member Functions

- **enable_shared_from_this** (const enable_shared_from_this &) noexcept
- enable_shared_from_this & **operator=** (const enable_shared_from_this &) noexcept

Friends

- template<typename _Tp1 >
  void **__enable_shared_from_this_helper** (const __shared_count<> &__pn, const enable_shared_from_this ∗-__pe, const _Tp1 ∗__px) noexcept

4.693.1 Detailed Description

template<typename _Tp>class std::enable_shared_from_this< _Tp >

Base class allowing use of member function shared_from_this.

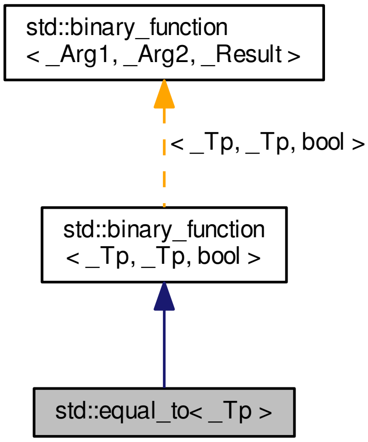
Definition at line 541 of file shared_ptr.h.

The documentation for this class was generated from the following file:

- shared_ptr.h

4.694 std::equal_to< _Tp > Struct Template Reference

Inheritance diagram for std::equal_to< _Tp >:



Public Types

- typedef _Tp first_argument_type
- typedef bool result_type
- typedef _Tp second_argument_type

Public Member Functions

- bool **operator()** (const _Tp &__x, const _Tp &__y) const

4.694.1 Detailed Description

template<typename _Tp>struct std::equal_to< _Tp >

One of the comparison functors.

Definition at line 204 of file stl_function.h.

4.694.2 Member Typedef Documentation

4.694.2.1 typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]

`first_argument_type` is the type of the first argument

Definition at line 117 of file stl_function.h.

4.694.2.2 typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]

`result_type` is the return type

Definition at line 123 of file stl_function.h.

4.694.2.3 typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]

`second_argument_type` is the type of the second argument

Definition at line 120 of file stl_function.h.

The documentation for this struct was generated from the following file:

- stl_function.h

4.695 std::error_category Class Reference

Public Member Functions

- int **value** () const noexcept

4.697.1 Detailed Description

error_condition

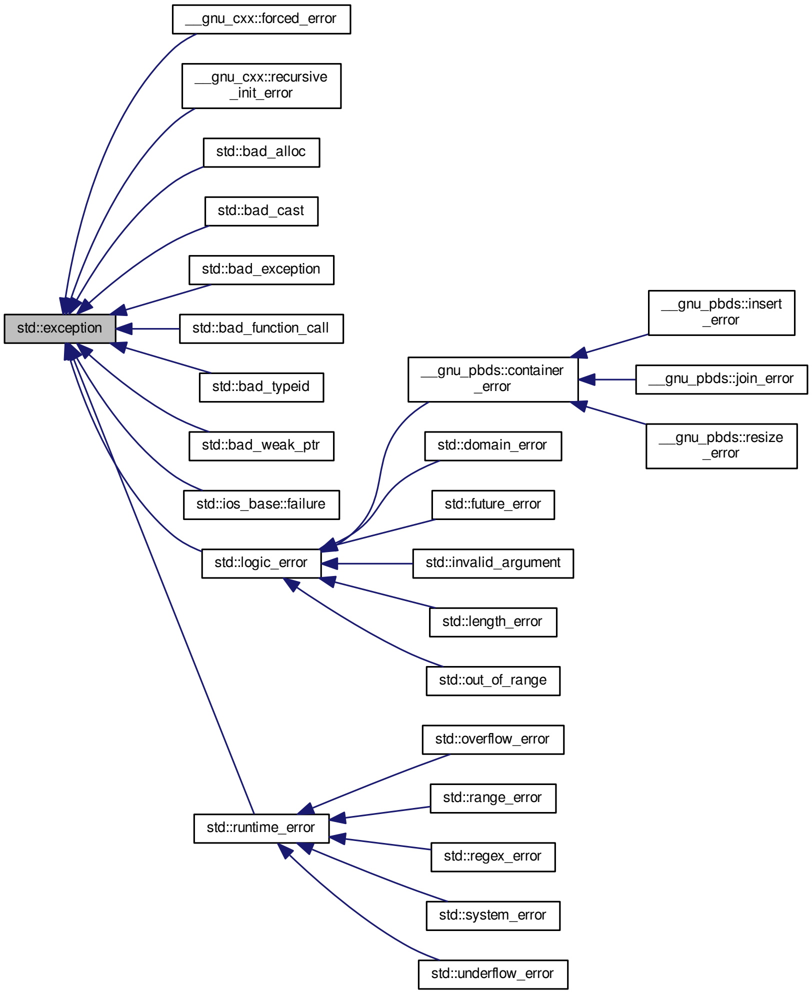
Definition at line 193 of file system_error.

The documentation for this struct was generated from the following file:

- system_error

4.698 std::exception Class Reference

Inheritance diagram for std::exception:



Public Member Functions

- virtual const char ∗ what () const noexcept

4.698.1 Detailed Description

Base class for all library exceptions.

This is the base class for all exceptions thrown by the standard library, and by certain language expressions. You are free to derive your own exception classes, or use a different hierarchy, or to throw non-class data (e.g., fundamental types).

Definition at line 60 of file exception.

4.698.2 Member Function Documentation

4.698.2.1 virtual const char∗ std::exception::what ( ) const [virtual], [noexcept]

Returns a C-style character string describing the general cause of the current error.

Reimplemented in std::bad_function_call, std::ios_base::failure, std::bad_typeid, std::bad_cast, std::runtime_error, std::future_error, std::bad_exception, std::logic_error, std::bad_weak_ptr, and std::bad_alloc.

The documentation for this class was generated from the following file:

- exception

Friends

- bool operator== (const exponential_distribution &__d1, const exponential_distribution &__d2)

4.699.1 Detailed Description

template<typename _RealType = double>class std::exponential_distribution< _RealType >

An exponential continuous distribution for random numbers.

The formula for the exponential probability density function is $p(x|\lambda) = \lambda e^{-\lambda x}$.

Mean	$\frac{1}{\lambda}$
Median	$\frac{\ln 2}{\lambda}$
Mode	$zero$
Range	$[0, \infty]$
Standard Deviation	$\frac{1}{\lambda}$

Table 1849: Distribution Statistics

Definition at line 4645 of file random.h.

4.699.2 Member Typedef Documentation

4.699.2.1 template<typename _RealType = double> typedef _RealType std::exponential_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 4648 of file random.h.

4.699.3 Constructor & Destructor Documentation

4.699.3.1 template<typename _RealType = double> std::exponential_distribution< _RealType >::exponential_distribution (const result_type & __*lambda* = result_type `(1)`) `[inline]`, `[explicit]`

Constructs an exponential distribution with inverse scale parameter λ.

Definition at line 4683 of file random.h.

4.699.4 Member Function Documentation

4.699.4.1 template<typename _RealType = double> _RealType std::exponential_distribution< _RealType >::lambda ( ) const `[inline]`

Returns the inverse scale parameter of the distribution.

Definition at line 4704 of file random.h.

4.699.4.2 template<typename _RealType = double> result_type std::exponential_distribution< _RealType >::max ( ) const `[inline]`

Returns the least upper bound value of the distribution.

Definition at line 4733 of file random.h.

References std::numeric_limits< _Tp >::max().

4.699.4.3 template<typename _RealType = double> result_type std::exponential_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 4726 of file random.h.

4.699.4.4 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::exponential_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

Definition at line 4741 of file random.h.

References std::exponential_distribution< _RealType >::operator()().

Referenced by std::exponential_distribution< _RealType >::operator()().

4.699.4.5 template<typename _RealType = double> param_type std::exponential_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 4711 of file random.h.

Referenced by std::operator>>().

4.699.4.6 template<typename _RealType = double> void std::exponential_distribution< _RealType >::param (const param_type & *__param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 4719 of file random.h.

4.699.4.7 template<typename _RealType = double> void std::exponential_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Has no effect on exponential distributions.

Definition at line 4698 of file random.h.

4.699.5 Friends And Related Function Documentation

4.699.5.1 template<typename _RealType = double> bool operator== (const exponential_distribution< _RealType > & *__d1*, const exponential_distribution< _RealType > & *__d2*) [friend]

Return true if two exponential distributions have the same parameters.

Definition at line 4781 of file random.h.

The documentation for this class was generated from the following files:

4.702.1 Detailed Description

template<typename _RealType = double>class std::extreme_value_distribution< _RealType >

A extreme_value_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|a,b) = \frac{1}{b}\exp(\frac{a-x}{b} - \exp(\frac{a-x}{b}))$$

Definition at line 5050 of file random.h.

4.702.2 Member Typedef Documentation

4.702.2.1 template<typename _RealType = double> typedef _RealType std::extreme_value_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 5053 of file random.h.

4.702.3 Member Function Documentation

4.702.3.1 template<typename _RealType = double> _RealType std::extreme_value_distribution< _RealType >::a ( ) const [inline]

Return the a parameter of the distribution.

Definition at line 5108 of file random.h.

4.702.3.2 template<typename _RealType = double> _RealType std::extreme_value_distribution< _RealType >::b ( ) const [inline]

Return the b parameter of the distribution.

Definition at line 5115 of file random.h.

4.702.3.3 template<typename _RealType = double> result_type std::extreme_value_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 5144 of file random.h.

References std::numeric_limits< _Tp >::max().

4.702.3.4 template<typename _RealType = double> result_type std::extreme_value_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 5137 of file random.h.

References std::numeric_limits< _Tp >::min().

4.702.3.5 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::extreme_value_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

4.704.1 Detailed Description

template<typename _RealType = double>class std::fisher_f_distribution< _RealType >

A fisher_f_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m,n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)}(\frac{m}{n})^{m/2}x^{(m/2)-1}(1+\frac{mx}{n})^{-(m+n)/2}$$

Definition at line 3130 of file random.h.

4.704.2 Member Typedef Documentation

4.704.2.1 template<typename _RealType = double> typedef _RealType std::fisher_f_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 3133 of file random.h.

4.704.3 Member Function Documentation

4.704.3.1 template<typename _RealType = double> result_type std::fisher_f_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 3224 of file random.h.

References std::numeric_limits< _Tp >::max().

4.704.3.2 template<typename _RealType = double> result_type std::fisher_f_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 3217 of file random.h.

4.704.3.3 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::fisher_f_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

Definition at line 3232 of file random.h.

4.704.3.4 template<typename _RealType = double> param_type std::fisher_f_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 3202 of file random.h.

4.704.3.5 template<typename _RealType = double> void std::fisher_f_distribution< _RealType >::param (const param_type & __param) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 3210 of file random.h.

4.704.3.6 template<typename _RealType = double> void std::fisher_f_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 3181 of file random.h.

References std::gamma_distribution< _RealType >::reset().

4.704.4 Friends And Related Function Documentation

4.704.4.1 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::fisher_f_distribution< _RealType1 > & __x) [friend]

Inserts a fisher_f_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A fisher_f_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.704.4.2 template<typename _RealType = double> bool operator== (const fisher_f_distribution< _RealType > & __d1, const fisher_f_distribution< _RealType > & __d2) [friend]

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3280 of file random.h.

4.704.4.3 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & __is, std::fisher_f_distribution< _RealType1 > & __x) [friend]

Extracts a fisher_f_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A fisher_f_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.707.1 Detailed Description

template<typename _Tp, typename _Alloc = allocator<_Tp>>class std::forward_list< _Tp, _Alloc >

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `sequence`, including the `optional sequence requirements` with the exception of `at` and `operator`[].

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike std::vector and std::deque, random-access iterators are not provided, so subscripting ([]) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, std::forward_list provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

Definition at line 408 of file forward_list.h.

4.707.2 Constructor & Destructor Documentation

4.707.2.1 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (const _Alloc & *__al* = `_Alloc()`) `[inline]`, `[explicit]`

Creates a forward_list with no elements.

Parameters

__al	An allocator object.

Definition at line 440 of file forward_list.h.

4.707.2.2 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (const **forward_list**< _Tp, _Alloc > & *__list*, const _Alloc & *__al*) `[inline]`

Copy constructor with allocator argument.

Parameters

__list	Input list to copy.
__al	An allocator object.

Definition at line 449 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::begin(), and std::forward_list< _Tp, _Alloc >::end().

4.707.2.3 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (**forward_list**< _Tp, _Alloc > && *__list*, const _Alloc & *__al*) `[inline]`, `[noexcept]`

Move constructor with allocator argument.

Parameters

__list	Input list to move.
__al	An allocator object.

Definition at line 458 of file forward_list.h.

4.707.2.4 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (size_type *__n*, const _Alloc & *__al* = `_Alloc()`) `[inline]`, `[explicit]`

Creates a forward_list with default constructed elements.

Parameters

__n	The number of elements to initially create.

This constructor creates the forward_list with *__n* default constructed elements.

Definition at line 471 of file forward_list.h.

4.707.2.5 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (size_type *__n*, const _Tp & *__value*, const _Alloc & *__al* = `_Alloc()`) `[inline]`

Creates a forward_list with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__al	An allocator object.

This constructor fills the forward_list with __*n* copies of __*value*.

Definition at line 484 of file forward_list.h.

4.707.2.6 template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (_InputIterator *__first*, _InputIterator *__last*, const _Alloc & *__al* = `_Alloc()`) `[inline]`

Builds a forward_list from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__al	An allocator object.

Create a forward_list consisting of copies of the elements from [__*first*,__*last*). This is linear in N (where N is distance(__*first*,__*last*)).

Definition at line 501 of file forward_list.h.

4.707.2.7 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (const **forward_list**< _Tp, _Alloc > & *__list*) `[inline]`

The forward_list copy constructor.

Parameters

__list	A forward_list of identical element and allocator types.

Definition at line 511 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::begin(), and std::forward_list< _Tp, _Alloc >::end().

4.707.2.8 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (**forward_list**< _Tp, _Alloc > && *__list*) `[inline]`, `[noexcept]`

The forward_list move constructor.

Parameters

__list	A forward_list of identical element and allocator types.

The newly-created forward_list contains the exact contents of __*list*. The contents of __*list* are a valid, but unspecified forward_list.

Definition at line 525 of file forward_list.h.

4.707.2.9 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::**forward_list** (**std::initializer_list**< _Tp > *__il*, const _Alloc & *__al* = `_Alloc()`) `[inline]`

Builds a forward_list from an initializer_list.

Parameters

__il	An initializer_list of value_type.
__al	An allocator object.

Create a forward_list consisting of copies of the elements in the initializer_list *__il*. This is linear in __il.size().

Definition at line 536 of file forward_list.h.

4.707.2.10 template<typename _Tp, typename _Alloc = allocator<_Tp>> **std::forward_list**< _Tp, _Alloc >::∼**forward_list** ( ) [inline], [noexcept]

The forward_list dtor.

Definition at line 544 of file forward_list.h.

4.707.3 Member Function Documentation

4.707.3.1 template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void **std::forward_list**< _Tp, _Alloc >::assign (_InputIterator *__first*, _InputIterator *__last*) [inline]

Assigns a range to a forward_list.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a forward_list with copies of the elements in the range [*__first*,*__last*).

Note that the assignment completely changes the forward_list and that the number of elements of the resulting forward_list is the same as the number of elements assigned. Old data is lost.

Definition at line 609 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::operator=().

4.707.3.2 template<typename _Tp, typename _Alloc = allocator<_Tp>> void **std::forward_list**< _Tp, _Alloc >::assign (size_type *__n*, const _Tp & *__val*) [inline]

Assigns a given value to a forward_list.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a forward_list with *__n* copies of the given value. Note that the assignment completely changes the forward_list, and that the resulting forward_list has __n elements. Old data is lost.

Definition at line 626 of file forward_list.h.

4.707.3.3 template<typename _Tp, typename _Alloc = allocator<_Tp>> void **std::forward_list**< _Tp, _Alloc >::assign (**std::initializer_list**< _Tp > *__il*) [inline]

Assigns an initializer_list to a forward_list.

Parameters

__il	An initializer_list of value_type.

Replace the contents of the forward_list with copies of the elements in the initializer_list *__il*. This is linear in il.size().

Definition at line 638 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::assign().

Referenced by std::forward_list< _Tp, _Alloc >::assign().

4.707.3.4 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::before_begin ( ) `[inline]`, `[noexcept]`

Returns a read/write iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 653 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::insert_after().

4.707.3.5 template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::before_begin ( ) const `[inline]`, `[noexcept]`

Returns a read-only (constant) iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 662 of file forward_list.h.

4.707.3.6 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::begin ( ) `[inline]`, `[noexcept]`

Returns a read/write iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 670 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::forward_list().

4.707.3.7 template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::begin ( ) const `[inline]`, `[noexcept]`

Returns a read-only (constant) iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 679 of file forward_list.h.

4.707.3.8 template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::cbefore_begin ( ) const `[inline]`, `[noexcept]`

Returns a read-only (constant) iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 715 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::emplace_front(), and std::forward_list< _Tp, _Alloc >::push_front().

4.707.3.9 template<typename _Tp, typename _Alloc = allocator<_Tp>> **const_iterator std::forward_list**< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 706 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::operator=(), and std::operator==().

4.707.3.10 template<typename _Tp, typename _Alloc = allocator<_Tp>> **const_iterator std::forward_list**< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

Definition at line 724 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::operator=(), and std::operator==().

4.707.3.11 template<typename _Tp, typename _Alloc = allocator<_Tp>> void **std::forward_list**< _Tp, _Alloc >::clear ( ) [inline], [noexcept]

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1027 of file forward_list.h.

4.707.3.12 template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> **iterator std::forward_list**< _Tp, _Alloc >::emplace_after (**const_iterator** *__pos*, _Args &&... *__args*) [inline]

Constructs object in forward_list after the specified iterator.

Parameters

__pos	A const_iterator into the forward_list.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) after the specified location. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 837 of file forward_list.h.

4.707.3.13 template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> void **std::forward_list**< _Tp, _Alloc >::emplace_front (_Args &&... *__args*) [inline]

Constructs object in forward_list at the front of the list.

Parameters

__args	Arguments.

This function will insert an object of type Tp constructed with Tp(std::forward<Args>(args)...) at the front of the list Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 781 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::cbefore_begin().

4.707.3.14 template<typename _Tp, typename _Alloc = allocator<_Tp>> bool std::forward_list< _Tp, _Alloc >::empty ( ) const `[inline]`, `[noexcept]`

Returns true if the forward_list is empty. (Thus begin() would equal end().)

Definition at line 732 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::insert_after().

4.707.3.15 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::end ( ) `[inline]`, `[noexcept]`

Returns a read/write iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

Definition at line 688 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::forward_list(), and std::forward_list< _Tp, _Alloc >::insert_after().

4.707.3.16 template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::end ( ) const `[inline]`, `[noexcept]`

Returns a read-only iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

Definition at line 697 of file forward_list.h.

4.707.3.17 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::erase_after (const_iterator *__pos*) `[inline]`

Removes the element pointed to by the iterator following `pos`.

Parameters

__pos	Iterator pointing before element to be erased.

Returns

An iterator pointing to the element following the one that was erased, or end() if no such element exists.

This function will erase the element at the given position and thus shorten the forward_list by one.

Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 940 of file forward_list.h.

4.707.3.18 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::erase_after (const_iterator *__pos*, const_iterator *__last*) `[inline]`

Remove a range of elements.

Parameters

__pos	Iterator pointing before the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

@ __last.

This function will erase the elements in the range (__pos,__last) and shorten the forward_list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 963 of file forward_list.h.

4.707.3.19 template<typename _Tp, typename _Alloc = allocator<_Tp>> reference std::forward_list< _Tp, _Alloc >::front ( ) [inline]

Returns a read/write reference to the data at the first element of the forward_list.

Definition at line 749 of file forward_list.h.

4.707.3.20 template<typename _Tp, typename _Alloc = allocator<_Tp>> const_reference std::forward_list< _Tp, _Alloc >::front ( ) const [inline]

Returns a read-only (constant) reference to the data at the first element of the forward_list.

Definition at line 760 of file forward_list.h.

4.707.3.21 template<typename _Tp, typename _Alloc = allocator<_Tp>> allocator_type std::forward_list< _Tp, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Get a copy of the memory allocation object.

Definition at line 643 of file forward_list.h.

4.707.3.22 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::insert_after (const_iterator *__pos*, const _Tp & *__val*) [inline]

Inserts given value into forward_list after specified iterator.

Parameters

__pos	An iterator into the forward_list.
__val	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 854 of file forward_list.h.

4.707.3.23 template<typename _Tp, typename _Alloc > forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (const_iterator *__pos,* size_type *__n,* const _Tp & *__val*)

Inserts a number of copies of given data into the forward_list.

Parameters

__pos	An iterator into the forward_list.
__n	Number of elements to be inserted.
__val	Data to be inserted.

Returns

An iterator pointing to the last inserted copy of *val* or *pos* if *n* == 0.

This function will insert a specified number of copies of the given data after the location specified by *pos*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 272 of file forward_list.tcc.

References std::forward_list< _Tp, _Alloc >::before_begin(), and std::forward_list< _Tp, _Alloc >::end().

4.707.3.24 template<typename _Tp , typename _Alloc > template<typename _InputIterator , typename > forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (const_iterator *__pos,* _InputIterator *__first,* _InputIterator *__last*)

Inserts a range into the forward_list.

Parameters

__pos	An iterator into the forward_list.
__first	An input iterator.
__last	An input iterator.

Returns

An iterator pointing to the last inserted element or *__pos* if *__first* == *__last*.

This function will insert copies of the data in the range [*__first*,*__last*) into the forward_list after the location specified by *__pos*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 287 of file forward_list.tcc.

References std::forward_list< _Tp, _Alloc >::before_begin(), std::forward_list< _Tp, _Alloc >::empty(), and std::forward_list< _Tp, _Alloc >::end().

4.707.3.25 template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::insert_after (const_iterator *__pos*, std::initializer_list< _Tp > *__il*) [inline]

Inserts the contents of an initializer_list into forward_list after the specified iterator.

Parameters

__pos	An iterator into the forward_list.
__il	An initializer_list of value_type.

Returns

An iterator pointing to the last inserted element or *__pos* if *__il* is empty.

This function will insert copies of the data in the initializer_list *__il* into the forward_list before the location specified by *__pos*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 919 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::insert_after().

Referenced by std::forward_list< _Tp, _Alloc >::insert_after().

4.707.3.26 template<typename _Tp, typename _Alloc = allocator<_Tp>> size_type std::forward_list< _Tp, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the largest possible number of elements of forward_list.

Definition at line 739 of file forward_list.h.

References std::allocator_traits< _Alloc >::max_size().

4.707.3.27 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::merge (forward_list< _Tp, _Alloc > && *__list*) [inline]

Merge sorted lists.

Parameters

__list	Sorted list to merge.

Assumes that both *list* and this list are sorted according to operator<(). Merges elements of *__list* into this list in sorted order, leaving *__list* empty when complete. Elements in this list precede elements in *__list* that are equal.

Definition at line 1165 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::merge().

Referenced by std::forward_list< _Tp, _Alloc >::merge().

4.707.3.28 template<typename _Tp , typename _Alloc > template<typename _Comp > void forward_list::merge (forward_list< _Tp, _Alloc > && *__list*, _Comp *__comp*)

Merge sorted lists according to comparison function.

Parameters

__list	Sorted list to merge.
__comp	Comparison function defining sort order.

Assumes that both *__list* and this list are sorted according to comp. Merges elements of *__list* into this list in sorted order, leaving *__list* empty when complete. Elements in this list precede elements in *__list* that are equivalent according to comp().

Definition at line 365 of file forward_list.tcc.

4.707.3.29 template< typename _Tp , typename _Alloc > forward_list< _Tp, _Alloc > & forward_list::operator= (const forward_list< _Tp, _Alloc > & *__list*)

The forward_list assignment operator.

Parameters

__list	A forward_list of identical element and allocator types.

All the elements of *__list* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 156 of file forward_list.tcc.

References std::forward_list< _Tp, _Alloc >::cbegin(), and std::forward_list< _Tp, _Alloc >::cend().

4.707.3.30 template< typename _Tp, typename _Alloc = allocator< _Tp>> forward_list& std::forward_list< _Tp, _Alloc >::operator= (forward_list< _Tp, _Alloc > && *__list*) `[inline]`, `[noexcept]`

The forward_list move assignment operator.

Parameters

__list	A forward_list of identical element and allocator types.

The contents of *__list* are moved into this forward_list (without copying, if the allocators permit it). *__list* is a valid, but unspecified forward_list

Definition at line 568 of file forward_list.h.

4.707.3.31 template< typename _Tp, typename _Alloc = allocator< _Tp>> forward_list& std::forward_list< _Tp, _Alloc >::operator= (std::initializer_list< _Tp > *__il*) `[inline]`

The forward_list initializer list assignment operator.

Parameters

__il	An initializer_list of value_type.

Replace the contents of the forward_list with copies of the elements in the initializer_list *__il*. This is linear in __il.size().

Definition at line 588 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::assign().

4.707.3.32 template< typename _Tp, typename _Alloc = allocator< _Tp>> void std::forward_list< _Tp, _Alloc >::pop_front ( ) `[inline]`

Removes first element.

This is a typical stack operation. It shrinks the forward_list by one. Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.

Definition at line 819 of file forward_list.h.

4.707.3.33 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::push_front (const _Tp & __val) [inline]

Add data to the front of the forward_list.

Parameters

__val	Data to be added.

This is a typical stack operation. The function creates an element at the front of the forward_list and assigns the given data to it. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 796 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::cbefore_begin().

4.707.3.34 template<typename _Tp, typename _Alloc > void forward_list::remove (const _Tp & __val)

Remove all elements equal to value.

Parameters

__val	The value to remove.

Removes every element in the list equal to *__val*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 300 of file forward_list.tcc.

References std::__addressof().

4.707.3.35 template<typename _Tp , typename _Alloc > template<typename _Pred > void forward_list::remove_if (_Pred __pred)

Remove all elements satisfying a predicate.

Parameters

__pred	Unary predicate function or object.

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 328 of file forward_list.tcc.

4.707.3.36 template<typename _Tp , typename _Alloc > void forward_list::resize (size_type __sz)

Resizes the forward_list to the specified number of elements.

Parameters

__sz	Number of elements the forward_list should contain.

This function will resize the forward_list to the specified number of elements. If the number is smaller than the forward_list's current number of elements the forward_list is truncated, otherwise the forward_list is extended and the new elements are default constructed.

Definition at line 198 of file forward_list.tcc.

References std::end().

4.707.3.37 template<typename _Tp , typename _Alloc > void forward_list::resize (size_type *__sz*, const value_type & *__val*)

Resizes the forward_list to the specified number of elements.

Parameters

__sz	Number of elements the forward_list should contain.
__val	Data with which new elements should be populated.

This function will resize the forward_list to the specified number of elements. If the number is smaller than the forward_list's current number of elements the forward_list is truncated, otherwise the forward_list is extended and new elements are populated with given data.

Definition at line 217 of file forward_list.tcc.

References std::end().

4.707.3.38 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::reverse ( ) [inline], [noexcept]

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1218 of file forward_list.h.

4.707.3.39 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::sort ( ) [inline]

Sort the elements of the list.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 1199 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::sort().

Referenced by std::forward_list< _Tp, _Alloc >::sort().

4.707.3.40 template<typename _Tp , class _Alloc > template<typename _Comp > void forward_list::sort (_Comp *__comp*)

Sort the forward_list using a comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 411 of file forward_list.tcc.

4.707.3.41 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::splice_after (const_iterator *__pos*, forward_list< _Tp, _Alloc > && *__list*) [inline]

Insert contents of another forward_list.

Parameters

__pos	Iterator referencing the element to insert after.
__list	Source list.

The elements of *list* are inserted in constant time after the element referenced by *pos*. *list* becomes an empty list.

Requires this != *x*.

Definition at line 1044 of file forward_list.h.

4.707.3.42 template<typename _Tp , typename _Alloc > void forward_list::splice_after (const_iterator *__pos*, forward_list< _Tp, _Alloc > && *__list*, const_iterator *__i*)

Insert element from another forward_list.

Parameters

__pos	Iterator referencing the element to insert after.
__list	Source list.
__i	Iterator referencing the element before the element to move.

Removes the element in list *list* referenced by *i* and inserts it into the current list after *pos*.

Definition at line 255 of file forward_list.tcc.

4.707.3.43 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::splice_after (const_iterator *__pos*, forward_list< _Tp, _Alloc > && , const_iterator *__before*, const_iterator *__last*) [inline]

Insert range from another forward_list.

Parameters

__pos	Iterator referencing the element to insert after.
__list	Source list.
__before	Iterator referencing before the start of range in list.
__last	Iterator referencing the end of range in list.

Removes elements in the range (__before,__last) and inserts them after *__pos* in constant time.

Undefined if *__pos* is in (__before,__last).

Definition at line 1087 of file forward_list.h.

4.707.3.44 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::swap (forward_list< _Tp, _Alloc > & *__list*) [inline], [noexcept]

Swaps data with another forward_list.

Parameters

__list	A forward_list of the same element and allocator types.

This exchanges the elements between two lists in constant time. Note that the global std::swap() function is specialized such that std::swap(l1,l2) will feed to this function.

Definition at line 980 of file forward_list.h.

Referenced by std::swap().

4.707.3.45 template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::unique ( ) [inline]

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1136 of file forward_list.h.

References std::forward_list< _Tp, _Alloc >::unique().

Referenced by std::forward_list< _Tp, _Alloc >::unique().

4.707.3.46 template<typename _Tp , typename _Alloc > template<typename _BinPred > void forward_list::unique (_BinPred *__binary_pred*)

Remove consecutive elements satisfying a predicate.

Parameters

__binary_pred	Binary predicate function or object.

For each consecutive set of elements [first,last) that satisfy predicate(first,i) where i is an iterator in [first,last), remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 344 of file forward_list.tcc.

References std::begin(), and std::end().

4.708 std::fpos< _StateT > Class Template Reference

Public Member Functions

- fpos (streamoff __off)
- operator streamoff () const
- fpos operator+ (streamoff __off) const
- fpos & operator+= (streamoff __off)
- fpos operator- (streamoff __off) const
- streamoff operator- (const fpos &__other) const
- fpos & operator-= (streamoff __off)
- void state (_StateT __st)
- _StateT state () const

4.708.1 Detailed Description

template<typename _StateT>class std::fpos< _StateT >

Class representing stream positions.

The standard places no requirements upon the template parameter StateT. In this implementation StateT must be DefaultConstructible, CopyConstructible and Assignable. The standard only requires that fpos should contain a member of type StateT. In this implementation it also contains an offset stored as a signed integer.

Parameters

StateT	Type passed to and returned from state().

Definition at line 112 of file postypes.h.

4.708.2 Constructor & Destructor Documentation

4.708.2.1 template<typename _StateT> std::fpos< _StateT >::fpos (streamoff *__off*) [inline]

Construct position from offset.

Definition at line 133 of file postypes.h.

4.708.3 Member Function Documentation

4.708.3.1 template<typename _StateT> std::fpos< _StateT >::operator streamoff ( ) const [inline]

Convert to streamoff.

Definition at line 137 of file postypes.h.

4.708.3.2 template<typename _StateT> fpos std::fpos< _StateT >::operator+ (streamoff *__off*) const [inline]

Add position and offset.

Definition at line 178 of file postypes.h.

4.708.3.3 template<typename _StateT> fpos& std::fpos< _StateT >::operator+= (streamoff *__off*) [inline]

Add offset to this position.

Definition at line 154 of file postypes.h.

4.708.3.4 template<typename _StateT> fpos std::fpos< _StateT >::operator- (streamoff *__off*) const [inline]

Subtract offset from position.

Definition at line 192 of file postypes.h.

4.708.3.5 template<typename _StateT> streamoff std::fpos< _StateT >::operator- (const fpos< _StateT > & *__other*) const [inline]

Subtract position to return offset.

Definition at line 205 of file postypes.h.

4.708.3.6 template<typename _StateT> fpos& std::fpos< _StateT >::operator-= (streamoff *__off*) [inline]

Subtract offset from this position.

Definition at line 165 of file postypes.h.

4.708.3.7 template<typename _StateT> void std::fpos< _StateT >::state (_StateT *__st*) [inline]

Remember the value of *st*.

Definition at line 141 of file postypes.h.

4.708.3.8 template<typename _StateT> _StateT **std::fpos**< _StateT >::state ( ) const [inline]

Return the last set value of *st*.

Definition at line 146 of file postypes.h.

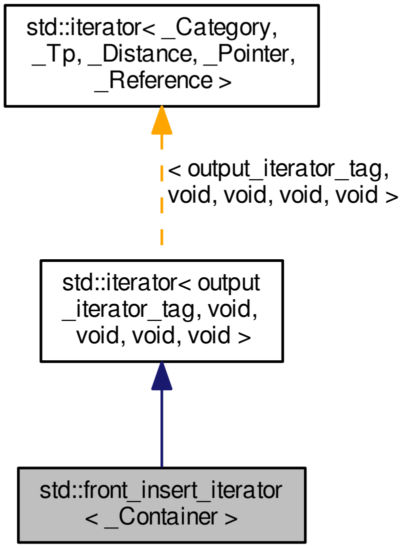
- postypes.h

4.709 std::front_insert_iterator< _Container > Class Template Reference

Inheritance diagram for std::front_insert_iterator< _Container >:



Public Types

- typedef _Container container_type
- typedef void difference_type
- typedef output_iterator_tag iterator_category
- typedef void pointer
- typedef void reference
- typedef void value_type

Public Member Functions

- front_insert_iterator (_Container &__x)
- front_insert_iterator & operator* ()

- front_insert_iterator & operator++ ()
- front_insert_iterator operator++ (int)
- front_insert_iterator & operator= (const typename _Container::value_type &__value)
- front_insert_iterator & **operator=** (typename _Container::value_type &&__value)

Protected Attributes

- _Container ∗ **container**

4.709.1 Detailed Description

template<typename _Container>class std::front_insert_iterator< _Container >

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using push_front.

Tip: Using the front_inserter function to create these iterators can save typing.

Definition at line 493 of file stl_iterator.h.

4.709.2 Member Typedef Documentation

4.709.2.1 template<typename _Container > typedef _Container std::front_insert_iterator< _Container >::container_type

A nested typedef for the type of whatever container you used.

Definition at line 501 of file stl_iterator.h.

4.709.2.2 typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.709.2.3 typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category [inherited]

One of the tag types.

Definition at line 121 of file stl_iterator_base_types.h.

4.709.2.4 typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file stl_iterator_base_types.h.

4.709.2.5 typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file stl_iterator_base_types.h.

4.709.2.6 typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file stl_iterator_base_types.h.

4.709.3 Constructor & Destructor Documentation

4.709.3.1 template<typename _Container > std::front_insert_iterator< _Container >::front_insert_iterator (_Container & __x) [inline], [explicit]

The only way to create this iterator is with a container.

Definition at line 504 of file stl_iterator.h.

4.709.4 Member Function Documentation

4.709.4.1 template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator* ( ) [inline]

Simply returns *this.

Definition at line 542 of file stl_iterator.h.

4.709.4.2 template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator++ ( ) [inline]

Simply returns *this. (This iterator does not *move*.)

Definition at line 547 of file stl_iterator.h.

4.709.4.3 template<typename _Container > front_insert_iterator std::front_insert_iterator< _Container >::operator++ (int) [inline]

Simply returns *this. (This iterator does not *move*.)

Definition at line 552 of file stl_iterator.h.

4.709.4.4 template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator= (const typename _Container::value_type & __value) [inline]

Parameters

__value	An instance of whatever type container_type::const_reference is; presumably a reference-to-const T for container<T>.

Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

Definition at line 526 of file stl_iterator.h.

4.710.1 Detailed Description

template<typename _Res, typename... _ArgTypes>class std::function< _Res(_ArgTypes...)>

Primary class template for std::function.

Polymorphic function wrapper.

Definition at line 2170 of file functional.

4.710.2 Constructor & Destructor Documentation

4.710.2.1 template<typename _Res , typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function ( ) `[inline]`, `[noexcept]`

Default construct creates an empty function call wrapper.

Postcondition

! (bool)∗this

Definition at line 2203 of file functional.

4.710.2.2 template<typename _Res , typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function (nullptr_t) [inline], [noexcept]

Creates an empty function call wrapper.

Postcondition

!(bool)*this

Definition at line 2210 of file functional.

4.710.2.3 template<typename _Res , typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function (const function< _Res(_ArgTypes...)> & __x)

Function copy constructor.

Parameters

__x	A function object with identical call signature.

Postcondition

`bool(*this)` == bool(__x)

The newly-created function contains a copy of the target of *__x* (if it has one).

Definition at line 2434 of file functional.

4.710.2.4 template<typename _Res , typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function (function< _Res(_ArgTypes...)> && __x) [inline]

Function move constructor.

Parameters

__x	A function object rvalue with identical call signature.

The newly-created function contains the target of *__x* (if it has one).

Definition at line 2230 of file functional.

4.710.2.5 template<typename _Res , typename... _ArgTypes> template<typename _Functor , typename > std::function< _Res(_ArgTypes...)>::function (_Functor __f)

Builds a function that targets a copy of the incoming function object.

Parameters

__f	A function object that is callable with parameters of type `T1`, `T2`, ..., `TN` and returns a value convertible to `Res`.

The newly-created function object will target a copy of *__f*. If *__f* is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If *__f* is a NULL function pointer or NULL pointer-to-member, the newly-created object will be empty.

If *__f* is a non-NULL function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

Definition at line 2448 of file functional.

4.710.3 Member Function Documentation

4.710.3.1 template<typename _Res , typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::operator bool ( ) const `[inline]`, `[explicit]`, `[noexcept]`

Determine if the function wrapper has a target.

Returns

`true` when this function object contains a target, or `false` when it is empty.

This function will not throw an exception.

Definition at line 2383 of file functional.

4.710.3.2 template<typename _Res , typename... _ArgTypes> _Res std::function< _Res(_ArgTypes...)>::operator() (_ArgTypes... *__args*) const

Invokes the function targeted by `*this`.

Returns

the result of the target.

Exceptions

bad_function_call	when !(bool)*this

The function call operator invokes the target function object stored by `this`.

Definition at line 2464 of file functional.

4.710.3.3 template<typename _Res , typename... _ArgTypes> function& std::function< _Res(_ArgTypes...)>::operator= (const function< _Res(_ArgTypes...)> & *__x*) `[inline]`

Function assignment operator.

Parameters

__x	A function with identical call signature.

Postcondition

(bool)*this == (bool)x

Returns

`*this`

The target of *__x* is copied to `*this`. If *__x* has no target, then `*this` will be empty.

If *__x* targets a function pointer or a reference to a function object, then this operation will not throw an exception.

Definition at line 2270 of file functional.

4.710.3.4 template<typename _Res , typename... _ArgTypes> function& std::function< _Res(_ArgTypes...)>::operator= (function< _Res(_ArgTypes...)> && __x) [inline]

Function move-assignment operator.

Parameters

__x	A function rvalue with identical call signature.

Returns

`*this`

The target of *__x* is moved to `*this`. If *__x* has no target, then `*this` will be empty.

If *__x* targets a function pointer or a reference to a function object, then this operation will not throw an exception.

Definition at line 2288 of file functional.

4.710.3.5 template<typename _Res , typename... _ArgTypes> function& std::function< _Res(_ArgTypes...)>::operator= (nullptr_t) [inline]

Function assignment to zero.

Postcondition

!(bool)*this

Returns

`*this`

The target of `*this` is deallocated, leaving it empty.

Definition at line 2302 of file functional.

4.710.3.6 template<typename _Res , typename... _ArgTypes> template<typename _Functor > _Requires<_Callable<_Functor>, function&> std::function< _Res(_ArgTypes...)>::operator= (_Functor && __f) [inline]

Function assignment to a new target.

Parameters

__f	A function object that is callable with parameters of type `T1`, `T2`, ..., `TN` and returns a value convertible to `Res`.

Returns

`*this`

This function object wrapper will target a copy of *__f*. If *__f* is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If *__f* is a NULL function pointer or NULL pointer-to-member, `this` object will be empty.

If *__f* is a non-NULL function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

Definition at line 2331 of file functional.

4.710.3.7 template<typename _Res , typename... _ArgTypes> template<typename _Functor > **function**& std::function< _Res(_ArgTypes...)>::operator= (**reference_wrapper**< _Functor > *__f*) `[inline]`, `[noexcept]`

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Definition at line 2340 of file functional.

4.710.3.8 template<typename _Res , typename... _ArgTypes> void std::function< _Res(_ArgTypes...)>::swap (**function**< _Res(_ArgTypes...)> & *__x*) `[inline]`

Swap the targets of two function objects.

Parameters

__x	A function with identical call signature.

Swap the targets of `this` function object and *__f*. This function will not throw an exception.

Definition at line 2355 of file functional.

4.710.3.9 template<typename _Res , typename... _ArgTypes> template<typename _Functor > _Functor ∗ std::function< _Res(_ArgTypes...)>::target ( ) `[noexcept]`

Access the stored target function object.

Returns

> Returns a pointer to the stored target function object, if `typeid(Functor)`.equals(target_type()); otherwise, a NULL pointer.

This function will not throw an exception.

Definition at line 2491 of file functional.

4.710.3.10 template<typename _Res , typename... _ArgTypes> template<typename _Functor > const _Functor ∗ std::function< _Res(_ArgTypes...)>::target ( ) const `[noexcept]`

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Definition at line 2510 of file functional.

4.710.3.11 template<typename _Res , typename... _ArgTypes> const **type_info** & std::function< _Res(_ArgTypes...)>::target_type ( ) const `[noexcept]`

Determine the type of the target of this function object wrapper.

Returns

> the type identifier of the target function object, or `typeid(void)` if !(bool)∗this.

This function will not throw an exception.

Definition at line 2475 of file functional.

4.712.1 Detailed Description

template<typename _RealType = double>class std::gamma_distribution< _RealType >

A gamma continuous distribution for random numbers.

The formula for the gamma probability density function is:

$$p(x|\alpha,\beta) = \frac{1}{\beta\Gamma(\alpha)}(x/\beta)^{\alpha-1}e^{-x/\beta}$$

Definition at line 2502 of file random.h.

4.712.2 Member Typedef Documentation

4.712.2.1 template<typename _RealType = double> typedef _RealType std::gamma_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 2505 of file random.h.

4.712.3 Constructor & Destructor Documentation

4.712.3.1 template<typename _RealType = double> std::gamma_distribution< _RealType >::gamma_distribution (_RealType *__alpha_val* = `_RealType(1)`, _RealType *__beta_val* = `_RealType(1)`) `[inline]`, `[explicit]`

Constructs a gamma distribution with parameters α and β.

Definition at line 2554 of file random.h.

4.712.4 Member Function Documentation

4.712.4.1 template<typename _RealType = double> _RealType std::gamma_distribution< _RealType >::alpha ( ) const `[inline]`

Returns the α of the distribution.

Definition at line 2575 of file random.h.

4.712.4.2 template<typename _RealType = double> _RealType std::gamma_distribution< _RealType >::beta ( ) const [inline]

Returns the β of the distribution.

Definition at line 2582 of file random.h.

4.712.4.3 template<typename _RealType = double> result_type std::gamma_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 2611 of file random.h.

4.712.4.4 template<typename _RealType = double> result_type std::gamma_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 2604 of file random.h.

4.712.4.5 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::gamma_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

Definition at line 2619 of file random.h.

References std::log(), and std::pow().

4.712.4.7 template<typename _RealType = double> param_type std::gamma_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 2589 of file random.h.

4.712.4.8 template<typename _RealType = double> void std::gamma_distribution< _RealType >::param (const param_type & *__param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 2597 of file random.h.

4.712.4.9 template<typename _RealType = double> void **std::gamma_distribution**< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 2568 of file random.h.

Referenced by std::chi_squared_distribution< _RealType >::reset(), std::fisher_f_distribution< _RealType >::reset(), std::student_t_distribution< _RealType >::reset(), and std::negative_binomial_distribution< _IntType >::reset().

4.712.5 Friends And Related Function Documentation

4.712.5.1 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > **std::basic_ostream**<_CharT, _Traits>& operator<< (**std::basic_ostream**< _CharT, _Traits > & *__os*, const **std::gamma_distribution**< _RealType1 > & *__x*) [friend]

Inserts a gamma_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A gamma_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.712.5.2 template<typename _RealType = double> bool operator== (const **gamma_distribution**< _RealType > & *__d1*, const **gamma_distribution**< _RealType > & *__d2*) [friend]

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2655 of file random.h.

4.712.5.3 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > **std::basic_istream**<_CharT, _Traits>& operator>> (**std::basic_istream**< _CharT, _Traits > & *__is*, **std::gamma_distribution**< _RealType1 > & *__x*) [friend]

Extracts a gamma_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A gamma_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

Friends

- template<typename _Tp >
  class **valarray**

4.718.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size.

For example, if you have offset==3, stride[0]==11, size[1]==3, stride[1]==3, then slice[0,0]==array[3], slice[0,1]==array[6], slice[0,2]==array[9], slice[1,0]==array[14], slice[1,1]==array[17], slice[1,2]==array[20].

Friends

- class **valarray< _Tp >**

4.719.1 Detailed Description

template<typename _Tp>class std::gslice_array< _Tp >

Reference to multi-dimensional subset of an array.

A gslice_array is a reference to the actual elements of an array specified by a gslice. The way to get a gslice_array is to call operator[](gslice) on a valarray. The returned gslice_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this gslice_array refers to.

Parameters

Tp	Element type.

Definition at line 60 of file gslice_array.h.

The documentation for this class was generated from the following file:

- gslice_array.h

- type_traits

4.724 std::hash< __debug::bitset< _Nb > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __debug::bitset< _Nb > &__b) const noexcept

4.724.1 Detailed Description

template<size_t _Nb>struct std::hash< __debug::bitset< _Nb > >

std::hash specialization for bitset.

Definition at line 415 of file debug/bitset.

The documentation for this struct was generated from the following file:

- debug/bitset

4.725 std::hash< __debug::vector< bool, _Alloc > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __debug::vector< bool, _Alloc > &__b) const noexcept

4.725.1 Detailed Description

template<typename _Alloc>struct std::hash< __debug::vector< bool, _Alloc > >

std::hash specialization for vector<bool>.

Definition at line 643 of file debug/vector.

The documentation for this struct was generated from the following file:

- debug/vector

4.726 std::hash< __gnu_cxx::__u16vstring > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __gnu_cxx::__u16vstring &__s) const noexcept

4.726.1 Detailed Description

template<>struct std::hash< __gnu_cxx::__u16vstring >

std::hash specialization for __u16vstring.

Definition at line 2826 of file vstring.h.

The documentation for this struct was generated from the following file:

- vstring.h

4.727 std::hash< __gnu_cxx::__u32vstring > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __gnu_cxx::__u32vstring &__s) const noexcept

4.727.1 Detailed Description

template<>struct std::hash< __gnu_cxx::__u32vstring >

std::hash specialization for __u32vstring.

Definition at line 2837 of file vstring.h.

The documentation for this struct was generated from the following file:

- vstring.h

4.728 std::hash< __gnu_cxx::__vstring > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __gnu_cxx::__vstring &__s) const noexcept

4.728.1 Detailed Description

template<>struct std::hash< __gnu_cxx::__vstring >

std::hash specialization for __vstring.

Definition at line 2802 of file vstring.h.

The documentation for this struct was generated from the following file:

- vstring.h

4.729 std::hash< __gnu_cxx::__wvstring > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __gnu_cxx::__wvstring &__s) const noexcept

4.729.1 Detailed Description

template<>struct std::hash< __gnu_cxx::__wvstring >

std::hash specialization for __wvstring.

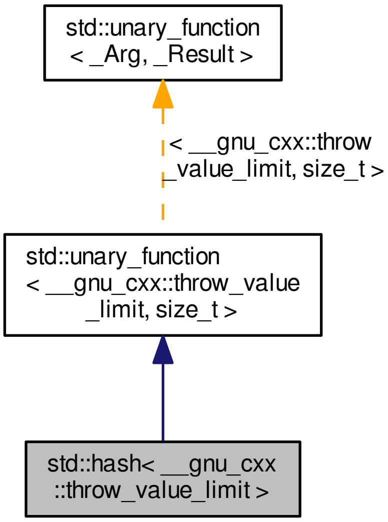
Definition at line 2813 of file vstring.h.

The documentation for this struct was generated from the following file:

- vstring.h

4.730 std::hash< __gnu_cxx::throw_value_limit > Struct Template Reference

Inheritance diagram for std::hash< __gnu_cxx::throw_value_limit >:



Public Types

- typedef __gnu_cxx::throw_value_limit argument_type
- typedef size_t result_type

Public Member Functions

- size_t **operator()** (const __gnu_cxx::throw_value_limit &__val) const

4.730.1 Detailed Description

template<>struct std::hash< __gnu_cxx::throw_value_limit >

Explicit specialization of std::hash for __gnu_cxx::throw_value_limit.

Definition at line 788 of file throw_allocator.h.

4.730.2 Member Typedef Documentation

4.730.2.1 typedef __gnu_cxx::throw_value_limit std::unary_function< __gnu_cxx::throw_value_limit , size_t >::argument_type `[inherited]`

`argument_type` is the type of the argument

Definition at line 104 of file stl_function.h.

4.730.2.2 typedef size_t std::unary_function< __gnu_cxx::throw_value_limit , size_t >::result_type `[inherited]`

`result_type` is the return type

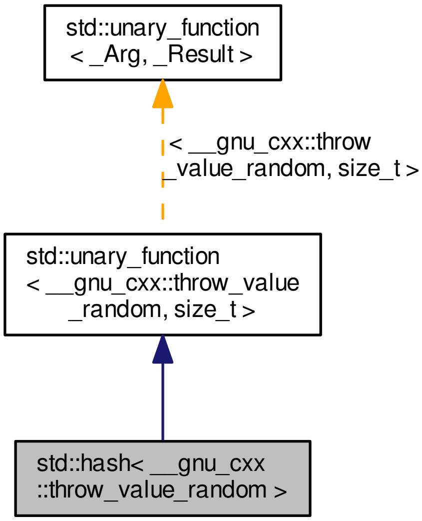
Definition at line 107 of file stl_function.h.

The documentation for this struct was generated from the following file:

- throw_allocator.h

4.731 std::hash< __gnu_cxx::throw_value_random > Struct Template Reference

Inheritance diagram for std::hash< __gnu_cxx::throw_value_random >:



Public Types

- typedef __gnu_cxx::throw_value_random argument_type
- typedef size_t result_type

Public Member Functions

- size_t **operator()** (const __gnu_cxx::throw_value_random &__val) const

4.731.1 Detailed Description

template<>struct std::hash< __gnu_cxx::throw_value_random >

Explicit specialization of std::hash for __gnu_cxx::throw_value_limit.

Definition at line 802 of file throw_allocator.h.

4.731.2 Member Typedef Documentation

4.731.2.1 typedef __gnu_cxx::throw_value_random std::unary_function< __gnu_cxx::throw_value_random , size_t >::argument_type [inherited]

`argument_type` is the type of the argument

Definition at line 104 of file stl_function.h.

4.731.2.2 typedef size_t std::unary_function< __gnu_cxx::throw_value_random , size_t >::result_type [inherited]

`result_type` is the return type

Definition at line 107 of file stl_function.h.

The documentation for this struct was generated from the following file:

- throw_allocator.h

4.732 std::hash< __profile::bitset< _Nb > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __profile::bitset< _Nb > &__b) const noexcept

4.732.1 Detailed Description

template<size_t _Nb>struct std::hash< __profile::bitset< _Nb > >

std::hash specialization for bitset.

Definition at line 371 of file profile/bitset.

The documentation for this struct was generated from the following file:

- profile/bitset

4.733 std::hash< __profile::vector< bool, _Alloc > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __profile::vector< bool, _Alloc > &__b) const noexcept

4.733.1 Detailed Description

template<typename _Alloc>struct std::hash< __profile::vector< bool, _Alloc > >

std::hash specialization for vector<bool>.

Definition at line 532 of file profile/vector.

The documentation for this struct was generated from the following file:

- profile/vector

4.734 std::hash< __shared_ptr< _Tp, _Lp > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const __shared_ptr< _Tp, _Lp > &__s) const noexcept

4.734.1 Detailed Description

template<typename _Tp, _Lock_policy _Lp>struct std::hash< __shared_ptr< _Tp, _Lp > >

std::hash specialization for __shared_ptr.

Definition at line 1442 of file shared_ptr_base.h.

The documentation for this struct was generated from the following file:

- shared_ptr_base.h

4.735 std::hash< _Tp * > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (_Tp ∗__p) const noexcept

4.735.1 Detailed Description

template<typename _Tp>struct std::hash< _Tp ∗ >

Partial specializations for pointer types.

Definition at line 62 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.736 std::hash< bool > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (bool __val) const noexcept

4.736.1 Detailed Description

template<>struct std::hash< bool >

Explicit specialization for bool.

Definition at line 80 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.737 std::hash< char > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (char __val) const noexcept

4.737.1 Detailed Description

template<>struct std::hash< char >

Explicit specialization for char.

Definition at line 83 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.738 std::hash< char16_t > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (char16_t __val) const noexcept

4.738.1 Detailed Description

template<>struct std::hash< char16_t >

Explicit specialization for char16_t.

Definition at line 95 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.739 std::hash< char32_t > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (char32_t __val) const noexcept

4.739.1 Detailed Description

template<>struct std::hash< char32_t >

Explicit specialization for char32_t.

Definition at line 98 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.740 std::hash< double > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (double __val) const noexcept

4.740.1 Detailed Description

template<>struct std::hash< double >

Specialization for double.

Definition at line 176 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.741 std::hash< error_code > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const error_code &__e) const noexcept

4.741.1 Detailed Description

template<>struct std::hash< error_code >

std::hash specialization for error_code.

Definition at line 360 of file system_error.

The documentation for this struct was generated from the following file:

- system_error

4.742 std::hash< float > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (float __val) const noexcept

4.742.1 Detailed Description

template<>struct std::hash< float >

Specialization for float.

Definition at line 164 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.743 std::hash< int > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (int __val) const noexcept

4.743.1 Detailed Description

template<>struct std::hash< int >

Explicit specialization for int.

Definition at line 104 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.744 std::hash< long > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (long __val) const noexcept

4.744.1 Detailed Description

template<>struct std::hash< long >

Explicit specialization for long.

Definition at line 107 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.745 std::hash< long double > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (long double __val) const noexcept

4.745.1 Detailed Description

template<>struct std::hash< long double >

Specialization for long double.

Definition at line 188 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.746 std::hash< long long > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (long long __val) const noexcept

4.746.1 Detailed Description

template<>struct std::hash< long long >

Explicit specialization for long long.

Definition at line 110 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.747 std::hash< shared_ptr< _Tp > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const shared_ptr< _Tp > &__s) const noexcept

4.747.1 Detailed Description

template<typename _Tp>struct std::hash< shared_ptr< _Tp > >

std::hash specialization for shared_ptr.

Definition at line 619 of file shared_ptr.h.

The documentation for this struct was generated from the following file:

- shared_ptr.h

4.748 std::hash< short > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (short __val) const noexcept

4.748.1 Detailed Description

template<>struct std::hash< short >

Explicit specialization for short.

Definition at line 101 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.749 std::hash< signed char > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (signed char __val) const noexcept

4.749.1 Detailed Description

template<>struct std::hash< signed char >

Explicit specialization for signed char.

Definition at line 86 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.750 std::hash< string > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const string &__s) const noexcept

4.750.1 Detailed Description

template<>struct std::hash< string >

std::hash specialization for string.

Definition at line 3046 of file basic_string.h.

The documentation for this struct was generated from the following file:

- basic_string.h

4.751 std::hash< thread::id > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const thread::id &__id) const noexcept

4.751.1 Detailed Description

template<>struct std::hash< thread::id >

std::hash specialization for thread::id.

Definition at line 222 of file thread.

The documentation for this struct was generated from the following file:

- thread

4.752 std::hash< type_index > Struct Template Reference

Public Types

- typedef type_index **argument_type**
- typedef size_t **result_type**

Public Member Functions

- size_t **operator()** (const type_index &__ti) const noexcept

4.752.1 Detailed Description

template<>struct std::hash< type_index >

std::hash specialization for type_index.

Definition at line 97 of file typeindex.

The documentation for this struct was generated from the following file:

- typeindex

4.753 std::hash< u16string > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const u16string &__s) const noexcept

4.753.1 Detailed Description

template<>struct std::hash< u16string >

std::hash specialization for u16string.

Definition at line 3079 of file basic_string.h.

The documentation for this struct was generated from the following file:

- basic_string.h

4.754 std::hash< u32string > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const u32string &__s) const noexcept

4.754.1 Detailed Description

template<>struct std::hash< u32string >

std::hash specialization for u32string.

Definition at line 3094 of file basic_string.h.

The documentation for this struct was generated from the following file:

- basic_string.h

4.755 std::hash< unique_ptr< _Tp, _Dp > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const unique_ptr< _Tp, _Dp > &__u) const noexcept

4.755.1 Detailed Description

template<typename _Tp, typename _Dp>struct std::hash< unique_ptr< _Tp, _Dp > >

std::hash specialization for unique_ptr.

Definition at line 599 of file unique_ptr.h.

The documentation for this struct was generated from the following file:

- unique_ptr.h

4.756 std::hash< unsigned char > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (unsigned char __val) const noexcept

4.756.1 Detailed Description

template<>struct std::hash< unsigned char >

Explicit specialization for unsigned char.

Definition at line 89 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.757 std::hash< unsigned int > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (unsigned int __val) const noexcept

4.757.1 Detailed Description

template<>struct std::hash< unsigned int >

Explicit specialization for unsigned int.

Definition at line 116 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.758 std::hash< unsigned long > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (unsigned long __val) const noexcept

4.758.1 Detailed Description

template<>struct std::hash< unsigned long >

Explicit specialization for unsigned long.

Definition at line 119 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.759 std::hash< unsigned long long > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (unsigned long long __val) const noexcept

4.759.1 Detailed Description

template<>struct std::hash< unsigned long long >

Explicit specialization for unsigned long long.

Definition at line 122 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.760 std::hash< unsigned short > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (unsigned short __val) const noexcept

4.760.1 Detailed Description

template<>struct std::hash< unsigned short >

Explicit specialization for unsigned short.

Definition at line 113 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.761 std::hash< wchar_t > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (wchar_t __val) const noexcept

4.761.1 Detailed Description

template<>struct std::hash< wchar_t >

Explicit specialization for wchar_t.

Definition at line 92 of file functional_hash.h.

The documentation for this struct was generated from the following file:

- functional_hash.h

4.762 std::hash< wstring > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const wstring &__s) const noexcept

4.762.1 Detailed Description

template<>struct std::hash< wstring >

std::hash specialization for wstring.

Definition at line 3061 of file basic_string.h.

The documentation for this struct was generated from the following file:

- basic_string.h

4.763 std::hash<::bitset< _Nb > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const ::bitset< _Nb > &__b) const noexcept

4.763.1 Detailed Description

template<size_t _Nb>struct std::hash<::bitset< _Nb > >

std::hash specialization for bitset.

Definition at line 1552 of file bitset.

The documentation for this struct was generated from the following file:

- bitset

4.764 std::hash<::vector< bool, _Alloc > > Struct Template Reference

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const ::vector< bool, _Alloc > &) const noexcept

4.764.1 Detailed Description

template<typename _Alloc>struct std::hash<::vector< bool, _Alloc > >

std::hash specialization for vector<bool>.

Definition at line 1143 of file stl_bvector.h.

The documentation for this struct was generated from the following files:

- stl_bvector.h
- vector.tcc

4.765 std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > Class Template Reference

Public Types

- typedef _UIntType result_type

Public Member Functions

4.765.1 Detailed Description

template<typename _RandomNumberEngine, size_t __w, typename _UIntType>class std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits `__w`.

Definition at line 1074 of file random.h.

4.765.2 Member Typedef Documentation

4.765.2.1 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> typedef _UIntType std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type

The type of the generated random value.

Definition at line 1077 of file random.h.

4.765.3 Constructor & Destructor Documentation

4.765.3.1 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ( ) `[inline]`

Constructs a default independent_bits_engine engine.

The underlying engine is default constructed as well.

Definition at line 1090 of file random.h.

4.765.3.2 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (const _RandomNumberEngine & *__rng*) [inline], [explicit]

Copy constructs a independent_bits_engine engine.

Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 1100 of file random.h.

4.765.3.3 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (_RandomNumberEngine && *__rng*) [inline], [explicit]

Move constructs a independent_bits_engine engine.

Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 1110 of file random.h.

4.765.3.4 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (result_type *__s*) [inline], [explicit]

Seed constructs a independent_bits_engine engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

__s	A seed value for the base class engine.

Definition at line 1120 of file random.h.

4.765.3.5 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _Sseq , typename = typename std::enable_if<!std::is_same<_Sseq, independent_bits_engine>::value && !std::is_same<_Sseq, _RandomNumberEngine>::value> ::type> std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (_Sseq & *__q*) [inline], [explicit]

Generator construct a independent_bits_engine engine.

Parameters

__q	A seed sequence.

Definition at line 1133 of file random.h.

4.765.4 Member Function Documentation

4.765.4.1 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> const _RandomNumberEngine& std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::base ( ) const [inline], [noexcept]

Gets a const reference to the underlying generator engine object.

Definition at line 1168 of file random.h.

Referenced by std::operator<<().

4.765.4.2 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::discard (unsigned long long __z) [inline]

Discard a sequence of random numbers.

Definition at line 1189 of file random.h.

4.765.4.3 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::max ( ) [inline], [static]

Gets the maximum value in the generated random number range.

Definition at line 1182 of file random.h.

4.765.4.4 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::min ( ) [inline], [static]

Gets the minimum value in the generated random number range.

Definition at line 1175 of file random.h.

4.765.4.5 template<typename _RandomNumberEngine , size_t __w, typename _UIntType > independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator() ( )

Gets the next value in the generated random number sequence.

Definition at line 745 of file bits/random.tcc.

References std::__lg(), std::numeric_limits< _Tp >::max(), and std::numeric_limits< _Tp >::min().

4.765.4.6 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed ( ) [inline]

Reseeds the independent_bits_engine object with the default seed for the underlying base class generator engine.

Definition at line 1142 of file random.h.

4.765.4.7 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed (result_type __s) [inline]

Reseeds the independent_bits_engine object with the default seed for the underlying base class generator engine.

Definition at line 1150 of file random.h.

4.765.4.8 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _Sseq > void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed (_Sseq & __q) [inline]

Reseeds the independent_bits_engine object with the given seed sequence.

Parameters

__q	A seed generator function.

Definition at line 1160 of file random.h.

4.765.5 Friends And Related Function Documentation

4.765.5.1 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> bool operator== (const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & *__lhs*, const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & *__rhs*) `[friend]`

Compares two independent_bits_engine random number generator objects of the same type for equality.

Parameters

__lhs	A independent_bits_engine random number generator object.
__rhs	Another independent_bits_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1214 of file random.h.

4.765.5.2 template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & *__is*, std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & *__x*) `[friend]`

Extracts the current state of a % subtract_with_carry_engine random number generator engine ___`x` from the input stream ___`is`.

Parameters

__is	An input stream.
__x	A independent_bits_engine random number generator engine.

Returns

The input stream with the state of ___`x` extracted or in an error state.

Definition at line 1232 of file random.h.

4.766.1 Detailed Description

template<class _Tp>class std::indirect_array< _Tp >

Reference to arbitrary subset of an array.

An indirect_array is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an indirect_array is to call operator[](valarray<size_t>) on a valarray. The returned indirect_array then permits carrying operations out on the referenced subset of elements in the original valarray.

For example, if an indirect_array is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have array[0]==3, array[2]==2, and array[4]==1.

Parameters

Tp	Element type.

Definition at line 62 of file indirect_array.h.

The documentation for this class was generated from the following file:

- indirect_array.h

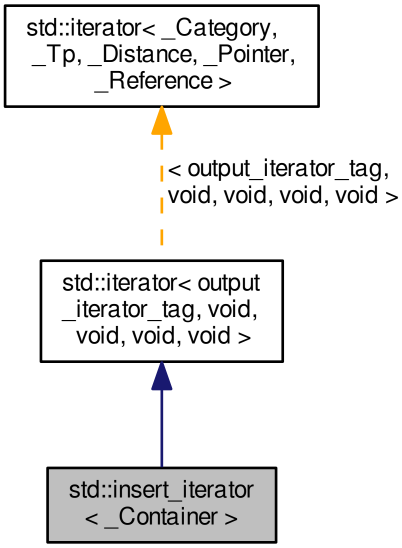
4.769 std::insert_iterator< _Container > Class Template Reference

Inheritance diagram for std::insert_iterator< _Container >:



Public Types

- typedef _Container container_type
- typedef void difference_type
- typedef output_iterator_tag iterator_category
- typedef void pointer
- typedef void reference
- typedef void value_type

Public Member Functions

- insert_iterator (_Container &__x, typename _Container::iterator __i)
- insert_iterator & operator* ()
- insert_iterator & operator++ ()
- insert_iterator & operator++ (int)
- insert_iterator & operator= (const typename _Container::value_type &__value)
- insert_iterator & **operator=** (typename _Container::value_type &&__value)

Protected Attributes

- _Container * **container**
- _Container::iterator **iter**

4.769.1 Detailed Description

template<typename _Container>class std::insert_iterator< _Container >

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the inserter function to create these iterators can save typing.

Definition at line 587 of file stl_iterator.h.

4.769.2 Member Typedef Documentation

4.769.2.1 template<typename _Container> typedef _Container **std::insert_iterator< _Container >::container_type**

A nested typedef for the type of whatever container you used.

Definition at line 596 of file stl_iterator.h.

4.769.2.2 typedef void **std::iterator< output_iterator_tag** , void , void , void , void **>::difference_type** `[inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.769.2.3 typedef **output_iterator_tag std::iterator< output_iterator_tag** , void , void , void , void **>::iterator_category** `[inherited]`

One of the tag types.

Definition at line 121 of file stl_iterator_base_types.h.

4.769.2.4 typedef void **std::iterator< output_iterator_tag** , void , void , void , void **>::pointer** `[inherited]`

This type represents a pointer-to-value_type.

Definition at line 127 of file stl_iterator_base_types.h.

4.769.2.5 typedef void **std::iterator< output_iterator_tag** , void , void , void , void **>::reference** `[inherited]`

This type represents a reference-to-value_type.

Definition at line 129 of file stl_iterator_base_types.h.

4.769.2.6 typedef void **std::iterator< output_iterator_tag** , void , void , void , void **>::value_type** `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file stl_iterator_base_types.h.

4.769.3 Constructor & Destructor Documentation

4.769.3.1 template<typename _Container> std::insert_iterator< _Container >::insert_iterator (_Container & *__x*, typename _Container::iterator *__i*) [inline]

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

Definition at line 602 of file stl_iterator.h.

4.769.4 Member Function Documentation

4.769.4.1 template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator* ( ) [inline]

Simply returns *this.

Definition at line 656 of file stl_iterator.h.

4.769.4.2 template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator++ ( ) [inline]

Simply returns *this. (This iterator does not *move*.)

Definition at line 661 of file stl_iterator.h.

4.769.4.3 template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator++ (int) [inline]

Simply returns *this. (This iterator does not *move*.)

Definition at line 666 of file stl_iterator.h.

4.769.4.4 template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator= (const typename _Container::value_type & *__value*) [inline]

Parameters

__value	An instance of whatever type container_type::const_reference is; presumably a reference-to-const T for container<T>.

Returns

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z

insert_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;

// vector v contains A, 1, 2, 3, and Z
```

Definition at line 638 of file stl_iterator.h.

The documentation for this class was generated from the following file:

- stl_iterator.h

4.772.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

Definition at line 199 of file ios_base.h.

4.772.2 Member Typedef Documentation

4.772.2.1 typedef void(∗ std::ios_base::event_callback)(event __e, ios_base &__b, int __i)

The type of an event callback function.

Parameters

__e	One of the members of the event enum.
__b	Reference to the ios_base object.
__i	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several ios_base and basic_ios functions, specifically imbue(), copyfmt(), and ∼ios().

Definition at line 436 of file ios_base.h.

4.772.2.2 typedef _Ios_Fmtflags std::ios_base::fmtflags

This is a bitmask type.

`_Ios_Fmtflags is` implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type fmtflags are:

- boolalpha
- dec
- fixed
- hex
- internal
- left
- oct
- right
- scientific
- showbase
- showpoint
- showpos
- skipws
- unitbuf
- uppercase
- adjustfield
- basefield
- floatfield

Definition at line 255 of file ios_base.h.

4.772.2.3 typedef _Ios_Iostate std::ios_base::iostate

This is a bitmask type.

`_Ios_Iostate is` implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type iostate are:

- badbit
- eofbit
- failbit
- goodbit

Definition at line 330 of file ios_base.h.

4.772.2.4 typedef _Ios_Openmode std::ios_base::openmode

This is a bitmask type.

`_Ios_Openmode is` implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type openmode are:

- app
- ate
- binary
- in
- out
- trunc

Definition at line 361 of file ios_base.h.

4.772.2.5 typedef _Ios_Seekdir std::ios_base::seekdir

This is an enumerated type.

`_Ios_Seekdir is` implementation-defined. Defined values of type seekdir are:

- beg
- cur, equivalent to `SEEK_CUR` in the C standard library.
- end, equivalent to `SEEK_END` in the C standard library.

Definition at line 393 of file ios_base.h.

4.772.3 Member Enumeration Documentation

4.772.3.1 enum std::ios_base::event

The set of events that may be passed to an event callback.

erase_event is used during ∼ios() and copyfmt(). imbue_event is used during imbue(). copyfmt_event is used during copyfmt().

Definition at line 419 of file ios_base.h.

4.772.4 Constructor & Destructor Documentation

4.772.4.1 virtual std::ios_base::∼ios_base ( ) [virtual]

Invokes each callback with erase_event. Destroys local storage.

Note that the ios_base object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with erase_event (unless copyfmt is used).

4.772.5 Member Function Documentation

4.772.5.1 const locale& std::ios_base::_M_getloc ( ) const [inline]

Locale access.

Returns

A reference to the current locale.

Like getloc above, but returns a reference instead of generating a copy.

Definition at line 706 of file ios_base.h.

Referenced by std::money_get< _CharT, _InIter >::do_get(), std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get_date(), std::time_get< _CharT, _InIter >::do_get_monthname(), std::time_get< _CharT, _InIter >::do_get_time(), std::time_get< _CharT, _InIter >::do_get_weekday(), std::time_get< _CharT, _InIter >::do_get_year(), std::time_put< _CharT, _OutIter >::do_put(), std::num_put< _CharT, _OutIter >::do_put(), and std::time_put< _CharT, _OutIter >::put().

4.772.5.2 fmtflags std::ios_base::flags ( ) const [inline]

Access to format flags.

Returns

The format control flags for both input and output.

Definition at line 551 of file ios_base.h.

Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), std::num_get< _CharT, _InIter >::do_get(), std::num_put< _CharT, _OutIter >::do_put(), std::basic_ostream< _CharT, _Traits >::operator<<(), std::operator<<(), std::operator>>(), and std::basic_istream< _CharT, _Traits >::sentry::sentry().

4.772.5.3 fmtflags std::ios_base::flags (fmtflags *__fmtfl*) [inline]

Setting new format flags all at once.

Parameters

__fmtfl	The new flags to set.

Returns

The previous format control flags.

This function overwrites all the format flags with *__fmtfl*.

Definition at line 562 of file ios_base.h.

4.772.5.4 **locale** std::ios_base::getloc ( ) const `[inline]`

Locale access.

Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Definition at line 695 of file ios_base.h.

Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), std::money_put< _CharT, _OutIter >::do_put(), std::operator>>(), and std::ws().

4.772.5.5 **locale** std::ios_base::imbue (const **locale** & *__loc*) throw ()

Setting a new locale.

Parameters

__loc	The new locale.

Returns

The previous locale.

Sets the new locale for this stream, and then invokes each callback with imbue_event.

Referenced by std::basic_ios< _CharT, _Traits >::imbue().

4.772.5.6 long& std::ios_base::iword (int *__ix*) `[inline]`

Access to integer array.

Parameters

__ix	Index into the array.

Returns

A reference to an integer associated with the index.

The iword function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use xalloc to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 741 of file ios_base.h.

4.772.5.7 **streamsize** std::ios_base::precision ( ) const `[inline]`

Flags access.

Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Definition at line 621 of file ios_base.h.

Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), and std::operator<<().

4.772.5.8 streamsize std::ios_base::precision (streamsize *__prec*) [inline]

Changing flags.

Parameters

__prec	The new precision value.

Returns

The previous value of precision().

Definition at line 630 of file ios_base.h.

4.772.5.9 void∗& std::ios_base::pword (int *__ix*) [inline]

Access to void pointer array.

Parameters

__ix	Index into the array.

Returns

A reference to a void∗ associated with the index.

The pword function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use xalloc to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 762 of file ios_base.h.

4.772.5.10 void std::ios_base::register_callback (event_callback *__fn,* int *__index*)

Add the callback __fn with parameter __index.

Parameters

__fn	The function to add.
__index	The integer to pass to the function when invoked.

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

4.772.5.11 fmtflags std::ios_base::setf (fmtflags *__fmtfl*) `[inline]`

Setting new format flags.

Parameters

__fmtfl	Additional flags to set.

Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

Definition at line 578 of file ios_base.h.

Referenced by std::dec(), std::fixed(), std::hex(), std::left(), std::oct(), std::right(), std::scientific(), std::showbase(), std::showpoint(), std::showpos(), std::skipws(), std::unitbuf(), and std::uppercase().

4.772.5.12 fmtflags std::ios_base::setf (fmtflags *__fmtfl,* fmtflags *__mask*) `[inline]`

Setting new format flags.

Parameters

__fmtfl	Additional flags to set.
__mask	The flags mask for *fmtfl*.

Returns

The previous format control flags.

This function clears *mask* in the format flags, then sets *fmtfl* `&` *mask*. An example mask is `ios_base::adjustfield`.

Definition at line 595 of file ios_base.h.

4.772.5.13 static bool std::ios_base::sync_with_stdio (bool *__sync* = `true`) `[static]`

Interaction with the standard C I/O objects.

Parameters

__sync	Whether to synchronize or not.

Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., stdout) and the standard C++ objects (e.g., cout). User-declared streams are unaffected. See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt1` `html`

4.772.5.14 void std::ios_base::unsetf (fmtflags *__mask*) `[inline]`

Clearing format flags.

Parameters

__mask	The flags to unset.

This function clears *__mask* in the format flags.

Definition at line 610 of file ios_base.h.

Referenced by std::noboolalpha(), std::noshowbase(), std::noshowpoint(), std::noshowpos(), std::noskipws(), std::nounitbuf(), and std::nouppercase().

4.772.5.15 streamsize std::ios_base::width ( ) const [inline]

Flags access.

Returns

The minimum field width to generate on output operations.

Minimum field width refers to the number of characters.

Definition at line 644 of file ios_base.h.

Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), std::num_put< _CharT, _OutIter >::do_put(), and std::operator>>().

4.772.5.16 streamsize std::ios_base::width (streamsize *__wide*) [inline]

Changing flags.

Parameters

__wide	The new width value.

Returns

The previous value of width().

Definition at line 653 of file ios_base.h.

4.772.5.17 static int std::ios_base::xalloc ( ) throw () [static]

Access to unique indices.

Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the iword and pword functions. The expectation is that an application calls xalloc in order to obtain an index in the iword and pword arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. xalloc is guaranteed to return an index that is safe to use in the iword and pword arrays.

4.772.6 Member Data Documentation

4.772.6.1 const **fmtflags** std::ios_base::adjustfield [static]

A mask of left|right|internal. Useful for the 2-arg form of `setf`.

Definition at line 310 of file ios_base.h.

Referenced by std::num_put< _CharT, _OutIter >::do_put(), std::internal(), std::left(), and std::right().

4.772.6.2 const **openmode** std::ios_base::app [static]

Seek to end before each write.

Definition at line 364 of file ios_base.h.

4.772.6.3 const **openmode** std::ios_base::ate [static]

Open and seek to end immediately after opening.

Definition at line 367 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::open().

4.772.6.4 const **iostate** std::ios_base::badbit [static]

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 334 of file ios_base.h.

Referenced by std::basic_ostream< char >::_M_write(), std::basic_ios< char, _Traits >::bad(), std::basic_ios< char, _Traits >::fail(), std::basic_ostream< _CharT, _Traits >::flush(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::getline(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_ostream< _CharT, _Traits >::operator<<(), std::operator<<(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_istream< _CharT, _Traits >::peek(), std::basic_ostream< _CharT, _Traits >::put(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >::read(), std::basic_istream< _CharT, _Traits >::readsome(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_ostream< _CharT, _Traits >::seekp(), std::basic_istream< _CharT, _Traits >::sync(), std::basic_istream< _CharT, _Traits >::tellg(), std::basic_ostream< _CharT, _Traits >::tellp(), std::basic_istream< _CharT, _Traits >::unget(), std::basic_ostream< _CharT, _Traits >::write(), and std::basic_ostream< _CharT, _Traits >::sentry::~sentry().

4.772.6.5 const **fmtflags** std::ios_base::basefield [static]

A mask of dec|oct|hex. Useful for the 2-arg form of `setf`.

Definition at line 313 of file ios_base.h.

Referenced by std::dec(), std::num_get< _CharT, _InIter >::do_get(), std::hex(), std::oct(), and std::basic_ostream< _CharT, _Traits >::operator<<().

4.772.6.6 const **seekdir** std::ios_base::beg [static]

Request a seek relative to the beginning of the stream.

Definition at line 396 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::seekpos().

4.772.6.7 const **openmode** std::ios_base::binary [static]

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch27s02.html`.

Definition at line 372 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::showmanyc().

4.772.6.8 const fmtflags std::ios_base::boolalpha [static]

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 258 of file ios_base.h.

Referenced by std::boolalpha(), std::num_get< _CharT, _InIter >::do_get(), std::num_put< _CharT, _OutIter >::do_put(), and std::noboolalpha().

4.772.6.9 const seekdir std::ios_base::cur [static]

Request a seek relative to the current position within the sequence.

Definition at line 399 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_istream< _CharT, _Traits >::tellg(), and std::basic_ostream< _CharT, _Traits >::tellp().

4.772.6.10 const fmtflags std::ios_base::dec [static]

Converts integer input or generates integer output in decimal base.

Definition at line 261 of file ios_base.h.

Referenced by std::dec().

4.772.6.11 const seekdir std::ios_base::end [static]

Request a seek relative to the current end of the sequence.

Definition at line 402 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::open(), and std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff().

4.772.6.12 const iostate std::ios_base::eofbit [static]

Indicates that an input operation reached the end of an input sequence.

Definition at line 337 of file ios_base.h.

Referenced by std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get_date(), std::time_get< _CharT, _InIter >::do_get_monthname(), std::time_get< _CharT, _InIter >::do_get_time(), std::time_get< _CharT, _InIter >::do_get_weekday(), std::time_get< _CharT, _InIter >::do_get_year(), std::basic_ios< char, _Traits >::eof(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::getline(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_istream< _CharT, _Traits >::peek(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >::read(), std::basic_istream< _CharT, _Traits >::readsome(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, _Traits >::sentry::sentry(), std::basic_istream< _CharT, _Traits >::unget(), and std::ws().

4.772.6.13 const iostate std::ios_base::failbit [static]

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 342 of file ios_base.h.

Referenced by std::basic_ifstream< _CharT, _Traits >::close(), std::basic_ofstream< _CharT, _Traits >::close(), std::basic_fstream< _CharT, _Traits >::close(), std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get_monthname(), std::time_get< _CharT, _InIter >::do_get_weekday(), std::time_get< _CharT, _InIter >::do_get_year(), std::basic_ios< char, _Traits >::fail(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::getline(), std::basic_ifstream< _CharT, _Traits >::open(), std::basic_ofstream< _CharT, _Traits >::open(), std::basic_fstream< _CharT, _Traits >::open(), std::basic_ostream< _CharT, _Traits >::operator<<(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_istream< _CharT, _Traits >::read(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_ostream< _CharT, _Traits >::seekp(), std::basic_ostream< _CharT, _Traits >::sentry::sentry(), and std::basic_istream< _CharT, _Traits >::sentry::sentry().

4.772.6.14 const **fmtflags** std::ios_base::fixed `[static]`

Generate floating-point output in fixed-point notation.

Definition at line 264 of file ios_base.h.

Referenced by std::fixed().

4.772.6.15 const **fmtflags** std::ios_base::floatfield `[static]`

A mask of scientific|fixed. Useful for the 2-arg form of `setf`.

Definition at line 316 of file ios_base.h.

Referenced by std::fixed(), and std::scientific().

4.772.6.16 const **iostate** std::ios_base::goodbit `[static]`

Indicates all is well.

Definition at line 345 of file ios_base.h.

Referenced by std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get_monthname(), std::time_get< _CharT, _InIter >::do_get_weekday(), std::time_get< _CharT, _InIter >::do_get_year(), std::basic_ostream< _CharT, _Traits >::flush(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::getline(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_ostream< _CharT, _Traits >::operator<<(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_istream< _CharT, _Traits >::peek(), std::basic_ostream< _CharT, _Traits >::put(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >::read(), std::basic_istream< _CharT, _Traits >::readsome(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_ostream< _CharT, _Traits >::seekp(), std::basic_istream< _CharT, _Traits >::sentry::sentry(), std::basic_istream< _CharT, _Traits >::sync(), and std::basic_istream< _CharT, _Traits >::unget().

4.772.6.17 const **fmtflags** std::ios_base::hex `[static]`

Converts integer input or generates integer output in hexadecimal base.

Definition at line 267 of file ios_base.h.

Referenced by std::num_get< _CharT, _InIter >::do_get(), std::num_put< _CharT, _OutIter >::do_put(), std::hex(), and std::basic_ostream< _CharT, _Traits >::operator<<().

4.772.6.18 const **openmode** std::ios_base::in `[static]`

Open for input. Default for `ifstream` and fstream.

Definition at line 375 of file ios_base.h.

Referenced by std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), std::basic_ifstream< _CharT, _Traits >::open(), std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::showmanyc(), std::basic_filebuf< _CharT, _Traits >::showmanyc(), std::basic-

_istream< _CharT, _Traits >::tellg(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(), std::basic_filebuf< _CharT, _Traits >::underflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

4.772.6.19 const **fmtflags** std::ios_base::internal `[static]`

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Definition at line 272 of file ios_base.h.

Referenced by std::internal().

4.772.6.20 const **fmtflags** std::ios_base::left `[static]`

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 276 of file ios_base.h.

Referenced by std::num_put< _CharT, _OutIter >::do_put(), and std::left().

4.772.6.21 const **fmtflags** std::ios_base::oct `[static]`

Converts integer input or generates integer output in octal base.

Definition at line 279 of file ios_base.h.

Referenced by std::oct(), and std::basic_ostream< _CharT, _Traits >::operator<<().

4.772.6.22 const **openmode** std::ios_base::out `[static]`

Open for output. Default for `ofstream` and fstream.

Definition at line 378 of file ios_base.h.

Referenced by std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), std::basic_ofstream< _CharT, _Traits >::open(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_ostream< _CharT, _Traits >::seekp(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_ostream< _CharT, _Traits >::tellp(), and std::basic_filebuf< _CharT, _Traits >::xsputn().

4.772.6.23 const **fmtflags** std::ios_base::right `[static]`

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 283 of file ios_base.h.

Referenced by std::right().

4.772.6.24 const **fmtflags** std::ios_base::scientific `[static]`

Generates floating-point output in scientific notation.

Definition at line 286 of file ios_base.h.

Referenced by std::scientific().

4.772.6.25 const **fmtflags** std::ios_base::showbase `[static]`

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 290 of file ios_base.h.

Referenced by std::noshowbase(), and std::showbase().

4.772.6.26 const **fmtflags** std::ios_base::showpoint `[static]`

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 294 of file ios_base.h.

Referenced by std::noshowpoint(), and std::showpoint().

4.772.6.27 const **fmtflags** std::ios_base::showpos `[static]`

Generates a + sign in non-negative generated numeric output.

Definition at line 297 of file ios_base.h.

Referenced by std::noshowpos(), and std::showpos().

4.772.6.28 const **fmtflags** std::ios_base::skipws `[static]`

Skips leading white space before certain input operations.

Definition at line 300 of file ios_base.h.

Referenced by std::noskipws(), std::basic_istream< _CharT, _Traits >::sentry::sentry(), and std::skipws().

4.772.6.29 const **openmode** std::ios_base::trunc `[static]`

Open for input. Default for `ofstream`.

Definition at line 381 of file ios_base.h.

4.772.6.30 const **fmtflags** std::ios_base::unitbuf `[static]`

Flushes output after each output operation.

Definition at line 303 of file ios_base.h.

Referenced by std::nounitbuf(), std::unitbuf(), and std::basic_ostream< _CharT, _Traits >::sentry::∼sentry().

4.772.6.31 const **fmtflags** std::ios_base::uppercase `[static]`

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 307 of file ios_base.h.

Referenced by std::num_put< _CharT, _OutIter >::do_put(), std::nouppercase(), and std::uppercase().

4.780.1 Detailed Description

template<typename _Signature>struct std::is_bind_expression< _Bind< _Signature > >

Class template _Bind is always a bind expression.

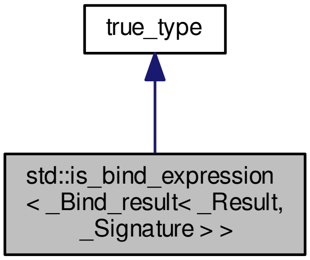
Definition at line 1567 of file functional.

The documentation for this struct was generated from the following file:

- functional

4.781 std::is_bind_expression< _Bind_result< _Result, _Signature > > Struct Template Reference

Inheritance diagram for std::is_bind_expression< _Bind_result< _Result, _Signature > >:



Public Types

- typedef integral_constant< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** ()

Static Public Attributes

- static constexpr _Tp **value**

4.781.1 Detailed Description

template<typename _Result, typename _Signature>struct std::is_bind_expression< _Bind_result< _Result, _Signature > >

Class template _Bind_result is always a bind expression.

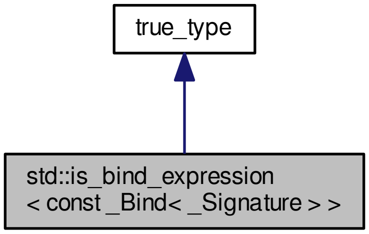
Definition at line 1599 of file functional.

The documentation for this struct was generated from the following file:

- functional

4.782 std::is_bind_expression< const _Bind< _Signature > > Struct Template Reference

Inheritance diagram for std::is_bind_expression< const _Bind< _Signature > >:



Public Types

- typedef integral_constant< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** ()

Static Public Attributes

- static constexpr _Tp **value**

4.782.1 Detailed Description

template<typename _Signature>struct std::is_bind_expression< const _Bind< _Signature > >

Class template _Bind is always a bind expression.

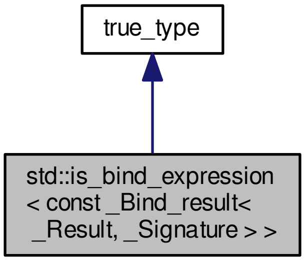
Definition at line 1575 of file functional.

The documentation for this struct was generated from the following file:

- functional

4.783 std::is_bind_expression< const _Bind_result< _Result, _Signature > > Struct Template Reference

Inheritance diagram for std::is_bind_expression< const _Bind_result< _Result, _Signature > >:



Public Types

- typedef integral_constant< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** ()

Static Public Attributes

- static constexpr _Tp **value**

4.783.1 Detailed Description

template<typename _Result, typename _Signature>struct std::is_bind_expression< const _Bind_result< _Result, _Signature > >

Class template _Bind_result is always a bind expression.

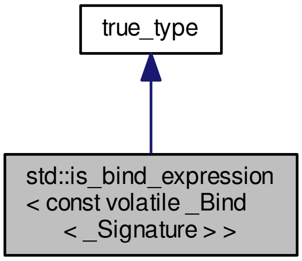
Definition at line 1607 of file functional.

The documentation for this struct was generated from the following file:

- functional

4.784 std::is_bind_expression< const volatile _Bind< _Signature > > Struct Template Reference

Inheritance diagram for std::is_bind_expression< const volatile _Bind< _Signature > >:



Public Types

- typedef integral_constant< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** ()

Static Public Attributes

- static constexpr _Tp **value**

4.784.1 Detailed Description

template<typename _Signature>struct std::is_bind_expression< const volatile _Bind< _Signature > >

Class template _Bind is always a bind expression.

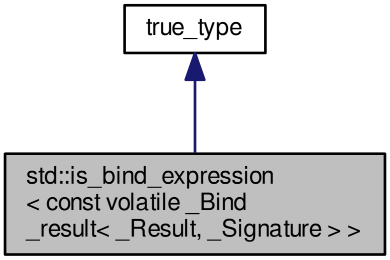
Definition at line 1591 of file functional.

The documentation for this struct was generated from the following file:

- functional

4.785 std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > > Struct Template Reference

Inheritance diagram for std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > >:



Public Types

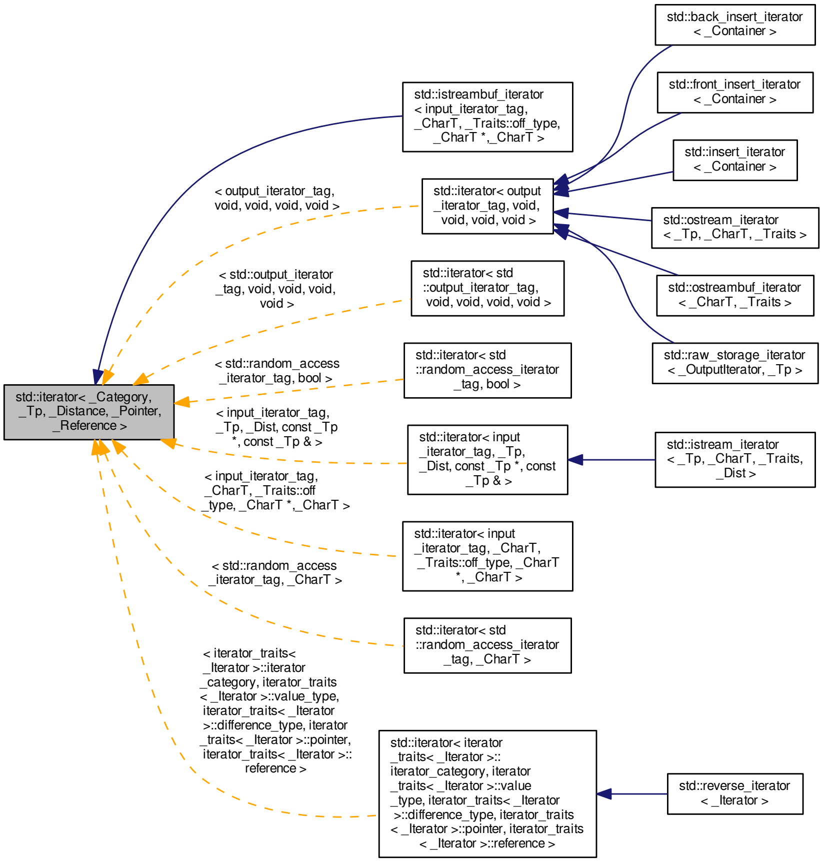
4.841 std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference > Struct Template Reference

Inheritance diagram for std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >:



Public Types

- typedef _Distance difference_type
- typedef _Category iterator_category
- typedef _Pointer pointer
- typedef _Reference reference
- typedef _Tp value_type

4.841.1 Detailed Description

template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp∗, typename _Reference = _Tp&>struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

Definition at line 118 of file stl_iterator_base_types.h.

4.841.2 Member Typedef Documentation

4.841.2.1 template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp∗, typename _Reference = _Tp&> typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_type

4.847.1 Detailed Description

template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>class std::linear_congruential_engine< _UIntType, __a, __c, __m >

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to (__m-1). If the template parameter `__m` is 0, the modulus `__m` used is std::numeric_limits<_UIntType>::max() plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

Definition at line 241 of file random.h.

4.847.2 Member Typedef Documentation

4.847.2.1 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> typedef _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::result_type

The type of the generated random value.

Definition at line 244 of file random.h.

4.847.3 Constructor & Destructor Documentation

4.847.3.1 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (result_type *__s* = `default_seed`) `[inline]`, `[explicit]`

Constructs a linear_congruential_engine random number generator engine with seed `__s`. The default seed value is 1.

Parameters

__s	The initial seed value.

Definition at line 268 of file random.h.

References std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

4.847.3.2 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq , typename = typename std::enable_if<!std::is_same<_Sseq, linear_congruential_engine>::value> ::type> std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (_Sseq & *__q*) [inline], [explicit]

Constructs a linear_congruential_engine random number generator engine seeded from the seed sequence `__q`.

Parameters

__q	the seed sequence.

Definition at line 281 of file random.h.

References std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

4.847.4 Member Function Documentation

4.847.4.1 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> void std::linear_congruential_engine< _UIntType, __a, __c, __m >::discard (unsigned long long *__z*) [inline]

Discard a sequence of random numbers.

Definition at line 325 of file random.h.

4.847.4.2 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::max ( ) [inline], [static]

Gets the largest possible value in the output range.

Definition at line 318 of file random.h.

4.847.4.3 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::min ( ) [inline], [static]

Gets the smallest possible value in the output range.

The minimum depends on the `__c` parameter: if it is zero, the minimum generated must be > 0, otherwise 0 is allowed.

Definition at line 311 of file random.h.

4.847.4.4 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::operator() ( ) [inline]

Gets the next random number in the sequence.

Definition at line 335 of file random.h.

4.847.4.5 template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m> void **std::linear_congruential_engine**< _UIntType, __a, __c, __m >::seed (**result_type** ***__s*** = `default_seed`)

Reseeds the linear_congruential_engine random number generator engine sequence to the seed `__s`.

Parameters

__s	The new seed.

Seeds the LCR with integral value `__s`, adjusted so that the ring identity is never a member of the convergence set.

Definition at line 120 of file bits/random.tcc.

Referenced by std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine().

4.847.4.6 template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq > **std::enable_if**< **std::is_class**< _Sseq >::value >::type **std::linear_congruential_engine**< _UIntType, __a, __c, __m >::seed (_Sseq & ***__q***)

Reseeds the linear_congruential_engine random number generator engine sequence using values from the seed sequence `__q`.

Parameters

__q	the seed sequence.

Seeds the LCR engine with a value generated by `__q`.

Definition at line 136 of file bits/random.tcc.

References std::__lg().

4.847.5 Friends And Related Function Documentation

4.847.5.1 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _UIntType1 , _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT , typename _Traits > **std::basic_ostream**<_CharT, _Traits>& operator<< (**std::basic_ostream**< _CharT, _Traits > & ***__os***, const **std::linear_congruential_engine**< _UIntType1, __a1, __c1, __m1 > & ***__lcr***) `[friend]`

Writes the textual representation of the state x(i) of x to `__os`.

Parameters

__os	The output stream.
__lcr	A % linear_congruential_engine random number generator.

Returns

__os.

4.847.5.2 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> bool operator== (const **linear_congruential_engine**< _UIntType, __a, __c, __m > & ***__lhs***, const **linear_congruential_engine**< _UIntType, __a, __c, __m > & ***__rhs***) `[friend]`

Compares two linear congruential random number generator objects of the same type for equality.

Parameters

__lhs	A linear congruential random number generator object.
__rhs	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 353 of file random.h.

4.847.5.3 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _UIntType1 , _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & *__is,* std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & *__lcr*) `[friend]`

Sets the state of the engine by reading its textual representation from `__is`.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments _CharT and _Traits were the same as those of `__is`.

Parameters

__is	The input stream.
__lcr	A % linear_congruential_engine random number generator.

Returns

__is.

4.847.6 Member Data Documentation

4.847.6.1 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::increment `[static]`

An increment.

Definition at line 255 of file random.h.

4.847.6.2 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::modulus `[static]`

The modulus.

Definition at line 257 of file random.h.

4.847.6.3 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::multiplier `[static]`

The multiplier.

Definition at line 253 of file random.h.

4.848.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>class std::list< _Tp, _Alloc >

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `reversible container`, and a `sequence`, including the `optional sequence requirements` with the exception of `at` and `operator`[].

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike std::vector and std::deque, random-access iterators are not provided, so subscripting ([]) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, std::list provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for list<Tp>:

First, we never actually allocate a Tp, we allocate List_node<Tp>'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from list<X,Alloc1> are spliced into list<X,Alloc2>, destroying the memory of the second list is a valid operation, i.e., Alloc1 giveth and Alloc2 taketh away.

Second, a list conceptually represented as

```
A <---> B <---> C <---> D
```

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private list::iterator pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's next/previous pointers refer to itself, the list is empty.

Definition at line 438 of file stl_list.h.

4.848.2 Constructor & Destructor Documentation

4.848.2.1 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list< _Tp, _Alloc >::list ( ) [inline]

Default constructor creates no elements.

Definition at line 523 of file stl_list.h.

4.848.2.2 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list< _Tp, _Alloc >::list (const allocator_type & *__a*) [inline], [explicit]

Creates a list with no elements.

Parameters

__a	An allocator object.

Definition at line 531 of file stl_list.h.

4.848.2.3 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list< _Tp, _Alloc >::list (size_type *__n*) [inline], [explicit]

Creates a list with default constructed elements.

Parameters

__n	The number of elements to initially create.

This constructor fills the list with *__n* default constructed elements.

Definition at line 543 of file stl_list.h.

4.848.2.4 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list< _Tp, _Alloc >::list (size_type *__n*, const value_type & *__value*, const allocator_type & *__a* = allocator_type()) [inline]

Creates a list with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator object.

This constructor fills the list with *__n* copies of *__value*.

Definition at line 555 of file stl_list.h.

4.848.2.5 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list< _Tp, _Alloc >::list (const list< _Tp, _Alloc > & *__x*) [inline]

List copy constructor.

Parameters

__x	A list of identical element and allocator types.

The newly-created list uses a copy of the allocation object used by *__x*.

Definition at line 582 of file stl_list.h.

4.848.2.6 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list< _Tp, _Alloc >::list (list< _Tp, _Alloc > && __x) [inline], [noexcept]

List move constructor.

Parameters

__x	A list of identical element and allocator types.

The newly-created list contains the exact contents of *__x*. The contents of *__x* are a valid, but unspecified list.

Definition at line 594 of file stl_list.h.

4.848.2.7 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list< _Tp, _Alloc >::list (initializer_list< value_type > __l, const allocator_type & __a = allocator_type()) [inline]

Builds a list from an initializer_list.

Parameters

__l	An initializer_list of value_type.
__a	An allocator object.

Create a list consisting of copies of the elements in the initializer_list *__l*. This is linear in __l.size().

Definition at line 605 of file stl_list.h.

4.848.2.8 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> std::list< _Tp, _Alloc >::list (_InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type()) [inline]

Builds a list from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__a	An allocator object.

Create a list consisting of copies of the elements from [*__first*,*__last*). This is linear in N (where N is distance(*__first*,*__last*)).

Definition at line 624 of file stl_list.h.

4.848.3 Member Function Documentation

4.848.3.1 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> _Node* std::list< _Tp, _Alloc >::_M_create_node (_Args &&... __args) [inline], [protected]

Parameters

__args	An instance of user data.

Allocates space for a new node and constructs a copy of *__args* in it.

Definition at line 500 of file stl_list.h.

4.848.3.2 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void **std::list**< _Tp, _Alloc >::assign (size_type *__n*, const value_type & *__val*) [inline]

Assigns a given value to a list.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a list with *__n* copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 702 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::operator=().

4.848.3.3 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void **std::list**< _Tp, _Alloc >::assign (_InputIterator *__first*, _InputIterator *__last*) [inline]

Assigns a range to a list.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a list with copies of the elements in the range [*__first*,*__last*).

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 721 of file stl_list.h.

4.848.3.4 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void **std::list**< _Tp, _Alloc >::assign (**initializer_list**< value_type > *__l*) [inline]

Assigns an initializer_list to a list.

Parameters

__l	An initializer_list of value_type.

Replace the contents of the list with copies of the elements in the initializer_list *__l*. This is linear in __l.size().

Definition at line 743 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::assign().

4.848.3.5 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference **std::list**< _Tp, _Alloc >::back ( ) [inline]

Returns a read/write reference to the data at the last element of the list.

Definition at line 943 of file stl_list.h.

4.848.3.6 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list< _Tp, _Alloc >::back ( ) const [inline]

Returns a read-only (constant) reference to the data at the last element of the list.

Definition at line 955 of file stl_list.h.

4.848.3.7 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 758 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::crend(), std::list< __inp, __rebind_inp >::front(), std::list< __inp, __rebind_inp >::list(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::operator=(), std::operator==(), std::list< __inp, __rebind_inp >::pop_front(), std::list< __inp, __rebind_inp >::push_front(), std::list< __inp, __rebind_inp >::rend(), std::list< __inp, __rebind_inp >::size(), std::list< _Tp, _Alloc >::sort(), and std::list< __inp, __rebind_inp >::splice().

4.848.3.8 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 767 of file stl_list.h.

4.848.3.9 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 831 of file stl_list.h.

4.848.3.10 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 840 of file stl_list.h.

4.848.3.11 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::clear ( ) [inline], [noexcept]

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1228 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::operator=().

4.848.3.12 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list< _Tp, _Alloc >::crbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 849 of file stl_list.h.

4.848.3.13 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list< _Tp, _Alloc >::crend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 858 of file stl_list.h.

4.848.3.14 template<typename _Tp , typename _Alloc > template<typename... _Args> list< _Tp, _Alloc >::iterator list::emplace (iterator __position, _Args &&... __args)

Constructs object in list before specified iterator.

Parameters

__position	A const_iterator into the list.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 88 of file list.tcc.

Referenced by std::list< __inp, __rebind_inp >::insert().

4.848.3.15 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::list< _Tp, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the list is empty. (Thus begin() would equal end().)

Definition at line 868 of file stl_list.h.

Referenced by std::list< _Tp, _Alloc >::sort(), and std::list< __inp, __rebind_inp >::splice().

4.848.3.16 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::end ( ) [inline], [noexcept]

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 776 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::back(), std::list< __inp, __rebind_inp >::crbegin(), std::list< __inp, __rebind_inp >::list(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::operator=(), std::operator==(), std::list< __inp, __rebind_inp >::push_back(), std::list< __inp, __rebind_inp >::rbegin(), std::list< __inp, __rebind_inp >::size(), and std::list< __inp, __rebind_inp >::splice().

4.848.3.17 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list< _Tp, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 785 of file stl_list.h.

4.848.3.18 template<typename _Tp , typename _Alloc > list< _Tp, _Alloc >::iterator list::erase (iterator __position)

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 109 of file list.tcc.

Referenced by std::list< __inp, __rebind_inp >::erase().

4.848.3.19 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::erase (iterator *__first,* iterator *__last*) [inline]

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [first,last) and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1193 of file stl_list.h.

4.848.3.20 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::list< _Tp, _Alloc >::front ( ) [inline]

Returns a read/write reference to the data at the first element of the list.

Definition at line 927 of file stl_list.h.

4.848.3.21 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list< _Tp, _Alloc >::front ( ) const [inline]

Returns a read-only (constant) reference to the data at the first element of the list.

Definition at line 935 of file stl_list.h.

4.848.3.22 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::list< _Tp, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Get a copy of the memory allocation object.

Definition at line 749 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::insert().

4.848.3.23 template<typename _Tp , typename _Alloc > list< _Tp, _Alloc >::iterator list::insert (iterator *__position,* const value_type & *__x*)

Inserts given value into list before specified iterator.

Parameters

__position	An iterator into the list.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 99 of file list.tcc.

4.848.3.24 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::insert (iterator *__position,* value_type && *__x*) [inline]

Inserts given rvalue into list before specified iterator.

Parameters

__position	An iterator into the list.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1089 of file stl_list.h.

4.848.3.25 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::insert (iterator *__p,* initializer_list< value_type > *__l*) [inline]

Inserts the contents of an initializer_list into list before specified iterator.

Parameters

__p	An iterator into the list.
__l	An initializer_list of value_type.

This function will insert copies of the data in the initializer_list *l* into the list before the location specified by *p*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1106 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::insert().

4.848.3.26 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::insert (iterator *__position,* size_type *__n,* const value_type & *__x*) [inline]

Inserts a number of copies of given data into the list.

Parameters

__position	An iterator into the list.
__n	Number of elements to be inserted.
__x	Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1123 of file stl_list.h.

4.848.3.27 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void std::list< _Tp, _Alloc >::insert (iterator *__position,* _InputIterator *__first,* _InputIterator *__last*) [inline]

Inserts a range into the list.

Parameters

__position	An iterator into the list.
__first	An input iterator.
__last	An input iterator.

This function will insert copies of the data in the range [*first*,*last*) into the list before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1149 of file stl_list.h.

4.848.3.28 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list< _Tp, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the size() of the largest possible list.

Definition at line 878 of file stl_list.h.

4.848.3.29 template<typename _Tp , typename _Alloc > void list::merge (list< _Tp, _Alloc > && *__x*)

Merge sorted lists.

Parameters

__x	Sorted list to merge.

Assumes that both *__x* and this list are sorted according to operator<(). Merges elements of *__x* into this list in sorted order, leaving *__x* empty when complete. Elements in this list precede elements in *__x* that are equal.

Definition at line 288 of file list.tcc.

References std::begin(), std::list< _Tp, _Alloc >::begin(), std::end(), and std::list< _Tp, _Alloc >::end().

Referenced by std::list< _Tp, _Alloc >::sort().

4.848.3.30 template<typename _Tp , typename _Alloc > template<typename _StrictWeakOrdering > void list::merge (list< _Tp, _Alloc > && *__x*, _StrictWeakOrdering *__comp*)

Merge sorted lists according to comparison function.

Template Parameters

_StrictWeakOrdering	Comparison function defining sort order.

Parameters

__x	Sorted list to merge.
__comp	Comparison functor.

Assumes that both *__x* and this list are sorted according to StrictWeakOrdering. Merges elements of *__x* into this list in sorted order, leaving *__x* empty when complete. Elements in this list precede elements in *__x* that are equivalent according to StrictWeakOrdering().

Definition at line 322 of file list.tcc.

References std::begin(), std::list< _Tp, _Alloc >::begin(), std::end(), and std::list< _Tp, _Alloc >::end().

4.848.3.31 template<typename _Tp , typename _Alloc > list< _Tp, _Alloc > & list::operator= (const list< _Tp, _Alloc > & *__x*)

List assignment operator.

No explicit dtor needed as the _Base dtor takes care of things. The _Base dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

__x	A list of identical element and allocator types.

All the elements of *__x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 185 of file list.tcc.

References std::begin(), std::list< _Tp, _Alloc >::begin(), std::end(), and std::list< _Tp, _Alloc >::end().

4.848.3.32 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list< _Tp, _Alloc >::operator= (list< _Tp, _Alloc > && *__x*) `[inline]`

List move assignment operator.

Parameters

__x	A list of identical element and allocator types.

The contents of *__x* are moved into this list (without copying). *__x* is a valid, but unspecified list

Definition at line 667 of file stl_list.h.

4.848.3.33 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list< _Tp, _Alloc >::operator= (initializer_list< value_type > *__l*) `[inline]`

List initializer list assignment operator.

Parameters

__l	An initializer_list of value_type.

Replace the contents of the list with copies of the elements in the initializer_list *__l*. This is linear in l.size().

Definition at line 684 of file stl_list.h.

4.848.3.34 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::pop_back ( ) [inline]

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

Definition at line 1041 of file stl_list.h.

4.848.3.35 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::pop_front ( ) [inline]

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.

Definition at line 1001 of file stl_list.h.

4.848.3.36 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::push_back (const value_type & *__x*) [inline]

Add data to the end of the list.

Parameters

__x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1015 of file stl_list.h.

4.848.3.37 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::push_front (const value_type & *__x*) [inline]

Add data to the front of the list.

Parameters

__x	Data to be added.

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 974 of file stl_list.h.

4.848.3.38 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list< _Tp, _Alloc >::rbegin ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 794 of file stl_list.h.

4.848.3.39 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list< _Tp, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 803 of file stl_list.h.

4.848.3.40 template<typename _Tp, typename _Alloc > void list::remove (const _Tp & *__value*)

Remove all elements equal to value.

Parameters

__value	The value to remove.

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 239 of file list.tcc.

References std::__addressof(), std::begin(), and std::end().

4.848.3.41 template<typename _Tp , typename _Alloc > template<typename _Predicate > void list::remove_if (_Predicate *__pred*)

Remove all elements satisfying a predicate.

Template Parameters

_Predicate	Unary predicate function or object.

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 392 of file list.tcc.

References std::begin(), and std::end().

4.848.3.42 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list< _Tp, _Alloc >::rend ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 812 of file stl_list.h.

4.848.3.43 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list< _Tp, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 821 of file stl_list.h.

4.848.3.44 template<typename _Tp , typename _Alloc > void list::resize (size_type *__new_size*)

Resizes the list to the specified number of elements.

Parameters

__new_size	Number of elements the list should contain.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

Definition at line 139 of file list.tcc.

References std::begin(), and std::end().

4.848.3.45 template<typename _Tp , typename _Alloc > void list::resize (size_type *__new_size,* const value_type & *__x*)

Resizes the list to the specified number of elements.

Parameters

__new_size	Number of elements the list should contain.
__x	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

Definition at line 154 of file list.tcc.

References std::begin(), and std::end().

4.848.3.46 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::reverse ( ) [inline], [noexcept]

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1449 of file stl_list.h.

4.848.3.47 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list< _Tp, _Alloc >::size ( ) const [inline], [noexcept]

Returns the number of elements in the list.

Definition at line 873 of file stl_list.h.

4.848.3.48 template<typename _Tp , typename _Alloc > void list::sort ( )

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 354 of file list.tcc.

References std::begin(), std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::empty(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::splice(), and std::list< _Tp, _Alloc >::swap().

4.848.3.49 template<typename _Tp , typename _Alloc > template<typename _StrictWeakOrdering > void list::sort (_StrictWeakOrdering *__comp*)

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 431 of file list.tcc.

References std::begin(), std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::empty(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::splice(), and std::list< _Tp, _Alloc >::swap().

4.848.3.50 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::splice (iterator *__position,* list< _Tp, _Alloc > && *__x*) [inline]

Insert contents of another list.

Parameters

__position	Iterator referencing the element to insert before.
__x	Source list.

The elements of *__x* are inserted in constant time in front of the element referenced by *__position*. *__x* becomes an empty list.

Requires this != *__x*.

Definition at line 1248 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::insert(), and std::list< _Tp, _Alloc >::sort().

4.848.3.51 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::splice (iterator *__position,* list< _Tp, _Alloc > && *__x,* iterator *__i*) [inline]

Insert element from another list.

Parameters

__position	Iterator referencing the element to insert before.
__x	Source list.
__i	Iterator referencing the element to move.

Removes the element in list *__x* referenced by *__i* and inserts it into the current list before *__position*.

Definition at line 1278 of file stl_list.h.

4.848.3.52 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::splice (iterator *__position,* list< _Tp, _Alloc > && *__x,* iterator *__first,* iterator *__last*) [inline]

Insert range from another list.

Parameters

__position	Iterator referencing the element to insert before.
__x	Source list.
__first	Iterator referencing the start of range in x.
__last	Iterator referencing the end of range in x.

Removes elements in the range [__first,__last) and inserts them before *__position* in constant time.

Undefined if __*position* is in [__first,__last).

Definition at line 1314 of file stl_list.h.

4.848.3.53 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::swap (list< _Tp, _Alloc > & __*x*) [inline]

Swaps data with another list.

Parameters

__*x*	A list of the same element and allocator types.

This exchanges the elements between two lists in constant time. Note that the global std::swap() function is specialized such that std::swap(l1,l2) will feed to this function.

Definition at line 1210 of file stl_list.h.

Referenced by std::list< __inp, __rebind_inp >::operator=(), std::list< _Tp, _Alloc >::sort(), and std::swap().

4.848.3.54 template<typename _Tp , typename _Alloc > void list::unique ( )

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 267 of file list.tcc.

References std::begin(), and std::end().

4.848.3.55 template<typename _Tp , typename _Alloc > template<typename _BinaryPredicate > void list::unique (_BinaryPredicate __*binary_pred*)

Remove consecutive elements satisfying a predicate.

Template Parameters

_*BinaryPredicate*	Binary predicate function or object.

For each consecutive set of elements [first,last) that satisfy predicate(first,i) where i is an iterator in [first,last), remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 410 of file list.tcc.

References std::begin(), and std::end().

The documentation for this class was generated from the following files:

- stl_list.h
- list.tcc

4.849 std::locale Class Reference

Classes

- class facet

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

- class id

  Facet ID class.

  The ID class provides facets with an index used to identify them. Every facet class must define a public static member locale::id, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The locale::id ensures that each class type gets a unique identifier.

Public Types

- typedef int category

4.849.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.

Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

Definition at line 62 of file locale_classes.h.

4.849.2 Member Typedef Documentation

4.849.2.1 typedef int **std::locale::category**

Definition of locale::category.

Definition at line 67 of file locale_classes.h.

4.849.3 Constructor & Destructor Documentation

4.849.3.1 std::locale::locale ( ) throw ()

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

Referenced by combine().

4.849.3.2 std::locale::locale (const **locale** & *__other*) throw ()

Copy constructor.

Constructs a copy of *other*.

Parameters

__other	The locale to copy.

4.849.3.3 std::locale::locale (const char * *__s*) [explicit]

Named locale constructor.

Constructs a copy of the named C library locale.

Parameters

__s	Name of the locale to construct.

Exceptions

std::runtime_error	if __s is null or an undefined locale.

4.849.3.4 std::locale::locale (const locale & *__base*, const char * *__s*, category *__cat*)

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If base is named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__s	Name of the locale to use facets from.
__cat	Set of categories defining the facets to use from __s.

Exceptions

std::runtime_error	if __s is null or an undefined locale.

4.849.3.5 std::locale::locale (const locale & *__base*, const locale & *__add*, category *__cat*)

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__add	The locale to use facets from.
__cat	Set of categories defining the facets to use from add.

4.849.3.6 template<typename _Facet > std::locale::locale (const locale & *__other*, _Facet * *__f*)

Construct locale with another facet.

Constructs a copy of the locale *__other*. The facet *__f* is added to *__other*, replacing an existing facet of type Facet if there is one. If *__f* is null, this locale is a copy of *__other*.

Parameters

__other	The locale to copy.
__f	The facet to add in.

Definition at line 45 of file locale_classes.tcc.

4.849.3.7 std::locale::∼locale ( ) throw ()

Locale destructor.

4.849.4 Member Function Documentation

4.849.4.1 static const locale& std::locale::classic ( ) [static]

Return reference to the C locale.

4.849.4.2 template<typename _Facet > locale std::locale::combine (const locale & __other) const

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type Facet from the locale *other* into the new locale.

Template Parameters

_Facet	The facet type to copy from other

Parameters

__other	The locale to copy from.

Returns

Newly constructed locale.

Exceptions

std::runtime_error	if __other has no facet of type _Facet.

Definition at line 63 of file locale_classes.tcc.

References locale().

4.849.4.3 static locale std::locale::global (const locale & __loc) [static]

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call std::setlocale(LC_ALL, loc.name()).

Parameters

__loc	The new locale to make global.

Returns

Copy of the old global locale.

4.849.4.4 string std::locale::name ( ) const

Return locale name.

Returns

Locale name or "∗" if unnamed.

4.849.4.5 bool std::locale::operator!= (const locale & *__other*) const throw () [inline]

Locale inequality.

Parameters

__other	The locale to compare against.

Returns

! (∗this == __other)

Definition at line 235 of file locale_classes.h.

References operator==().

4.849.4.6 template<typename _Char , typename _Traits , typename _Alloc > bool std::locale::operator() (const basic_string< _Char, _Traits, _Alloc > & *__s1,* const basic_string< _Char, _Traits, _Alloc > & *__s2*) const

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector v of strings could be sorted according to locale loc by doing:

```
std::sort(v.begin(), v.end(), loc);
```

Parameters

__s1	First string to compare.
__s2	Second string to compare.

Returns

True if collate<_Char> facet compares __s1 < __s2, else false.

4.849.4.7 const locale& std::locale::operator= (const locale & *__other*) throw ()

Assignment operator.

Set this locale to be a copy of *other*.

Parameters

__other	The locale to copy.

Returns

A reference to this locale.

4.849.4.8 bool std::locale::operator== (const locale & *__other*) const throw ()

Locale equality.

Parameters

__other	The locale to compare against.

Returns

True if other and this refer to the same locale instance, are copies, or have the same name. False otherwise.

Referenced by operator!=().

4.849.5 Friends And Related Function Documentation

4.849.5.1 template<typename _Facet > bool has_facet (const locale &) throw () [friend]

Test for the presence of a facet.

has_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

_Facet	The facet type to test the presence of.

Parameters

__loc	The locale to test.

Returns

true if __`loc` contains a facet of type _Facet, else false.

Definition at line 104 of file locale_classes.tcc.

4.849.5.2 template<typename _Facet > const _Facet& use_facet (const locale &) [friend]

Return a facet.

use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_facet(locale) is true, there is a suitable facet to return. It throws std::bad_cast if the locale doesn't contain a facet of type Facet.

Template Parameters

_Facet	The facet type to access.

Parameters

__loc	The locale to use.

Returns

Reference to facet of type Facet.

Exceptions

std::bad_cast	if `__loc` doesn't contain a facet of type _Facet.

Definition at line 132 of file locale_classes.tcc.

4.849.6 Member Data Documentation

4.849.6.1 const category std::locale::all `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 105 of file locale_classes.h.

4.849.6.2 const category std::locale::collate `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 101 of file locale_classes.h.

4.849.6.3 const category std::locale::ctype `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 99 of file locale_classes.h.

4.849.6.4 const category std::locale::messages `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 104 of file locale_classes.h.

4.849.6.5 const **category** std::locale::monetary `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 103 of file locale_classes.h.

4.849.6.6 const **category** std::locale::none `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 98 of file locale_classes.h.

4.849.6.7 const **category** std::locale::numeric `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 100 of file locale_classes.h.

4.849.6.8 const **category** std::locale::time `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 102 of file locale_classes.h.

- static __c_locale **_S_lc_ctype_c_locale** (__c_locale __cloc, const char ∗__s)

Friends

- class **locale**
- class **locale::_Impl**

4.850.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

Definition at line 338 of file locale_classes.h.

4.850.2 Constructor & Destructor Documentation

4.850.2.1 std::locale::facet::facet (size_t *__refs* = 0) throw () [inline], [explicit], [protected]

Facet constructor.

This is the constructor provided by the standard. If refs is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

Parameters

__refs	The initial value for reference count.

Definition at line 370 of file locale_classes.h.

4.850.2.2 virtual std::locale::facet::∼facet ( ) [protected], [virtual]

Facet destructor.

The documentation for this class was generated from the following file:

- locale_classes.h

4.851 std::locale::id Class Reference

Public Member Functions

- id ()
- size_t **_M_id** () const throw ()

Friends

- template<typename _Facet >
  bool has_facet (const locale &) throw ()
- class **locale**
- class **locale::_Impl**
- template<typename _Facet >
  const _Facet & use_facet (const locale &)

4.851.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member locale::id, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The locale::id ensures that each class type gets a unique identifier.

Definition at line 436 of file locale_classes.h.

4.851.2 Constructor & Destructor Documentation

4.851.2.1 std::locale::id::id ( ) `[inline]`

Constructor.

Definition at line 467 of file locale_classes.h.

4.851.3 Friends And Related Function Documentation

4.851.3.1 template<typename _Facet > bool has_facet (const locale &) throw () `[friend]`

Test for the presence of a facet.

has_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

_Facet	The facet type to test the presence of.

Parameters

__loc	The locale to test.

Returns

true if `__loc` contains a facet of type _Facet, else false.

Definition at line 104 of file locale_classes.tcc.

4.851.3.2 template<typename _Facet > const _Facet& use_facet (const locale &) `[friend]`

Return a facet.

use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_facet(locale) is true, there is a suitable facet to return. It throws std::bad_cast if the locale doesn't contain a facet of type Facet.

Template Parameters

_Facet	The facet type to access.

Parameters

__loc	The locale to use.

Returns

Reference to facet of type Facet.

Exceptions

std::bad_cast	if __`loc` doesn't contain a facet of type _Facet.

Definition at line 132 of file locale_classes.tcc.

4.852.1 Detailed Description

template<typename _Mutex>class std::lock_guard< _Mutex >

Scoped lock idiom.

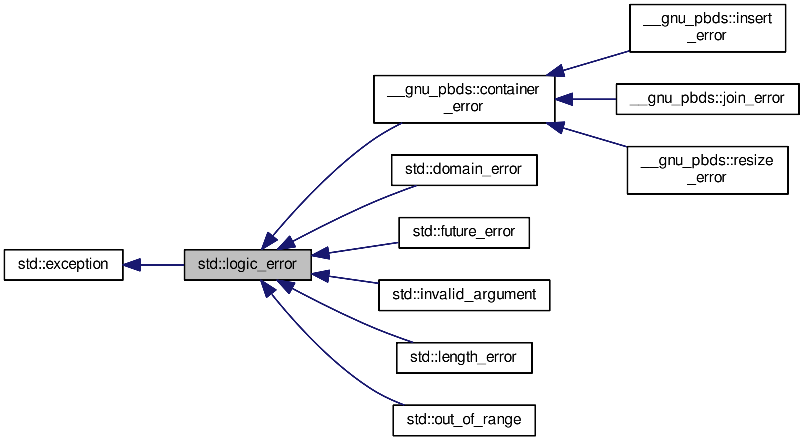
Definition at line 406 of file mutex.

The documentation for this class was generated from the following file:

- mutex

4.853 std::logic_error Class Reference

Inheritance diagram for std::logic_error:



Public Member Functions

- logic_error (const string &__arg)
- virtual const char ∗ what () const noexcept

4.853.1 Detailed Description

One of two subclasses of exception.

Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

Definition at line 55 of file stdexcept.

4.853.2 Constructor & Destructor Documentation

4.853.2.1 std::logic_error::logic_error (const string & *__arg*) `[explicit]`

Takes a character string describing the error.

4.853.3 Member Function Documentation

4.853.3.1 virtual const char∗ std::logic_error::what ( ) const `[virtual]`, `[noexcept]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.

Reimplemented in std::future_error.

The documentation for this class was generated from the following file:

- stdexcept

4.857.1 Detailed Description

template<typename _RealType = double>class std::lognormal_distribution< _RealType >

A lognormal_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m,s) = \frac{1}{sx\sqrt{2\pi}} \exp{-\frac{(\ln{x} - m)^2}{2s^2}}$$

Definition at line 2298 of file random.h.

4.857.2 Member Typedef Documentation

4.857.2.1 template<typename _RealType = double> typedef _RealType std::lognormal_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 2301 of file random.h.

4.857.3 Member Function Documentation

4.857.3.1 template<typename _RealType = double> result_type std::lognormal_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 2389 of file random.h.

References std::numeric_limits< _Tp >::max().

4.857.3.2 template<typename _RealType = double> result_type std::lognormal_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 2382 of file random.h.

4.857.3.3 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::lognormal_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

Definition at line 2397 of file random.h.

References std::lognormal_distribution< _RealType >::operator()().

Referenced by std::lognormal_distribution< _RealType >::operator()().

4.857.3.4 template<typename _RealType = double> param_type std::lognormal_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 2367 of file random.h.

4.857.3.5 template<typename _RealType = double> void std::lognormal_distribution< _RealType >::param (const param_type & *__param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 2375 of file random.h.

4.857.3.6 template<typename _RealType = double> void std::lognormal_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 2349 of file random.h.

References std::normal_distribution< _RealType >::reset().

4.857.4 Friends And Related Function Documentation

4.857.4.1 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & *__os*, const std::lognormal_distribution< _RealType1 > & *__x*) [friend]

Inserts a lognormal_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A lognormal_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.857.4.2 template<typename _RealType = double> bool operator== (const **lognormal_distribution**< _RealType > & *__d1*, const **lognormal_distribution**< _RealType > & *__d2*) `[friend]`

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2434 of file random.h.

4.857.4.3 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > **std::basic_istream**<_CharT, _Traits>& operator>> (**std::basic_istream**< _CharT, _Traits > & *__is*, **std::lognormal_distribution**< _RealType1 > & *__x*) `[friend]`

Extracts a lognormal_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A lognormal_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

4.861.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>class std::map< _Key, _Tp, _Compare, _Alloc >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>.

Meets the requirements of a `container`, a `reversible container`, and an `associative container` (using unique keys). For a `map<Key,T>` the key_type is Key, the mapped_type is T, and the value_type is std::pair<const Key,T>.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for map and multimap; the distinction is made entirely in how the tree functions are called (∗_unique versus ∗_equal, same as the standard).

Definition at line 96 of file stl_map.h.

4.861.2 Constructor & Destructor Documentation

4.861.2.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map ( ) `[inline]`

Default constructor creates no elements.

Definition at line 160 of file stl_map.h.

4.861.2.2 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map (const _Compare & *__comp,* const allocator_type & *__a* = `allocator_type()`) `[inline]`, `[explicit]`

Creates a map with no elements.

Parameters

__comp	A comparison object.
__a	An allocator object.

Definition at line 169 of file stl_map.h.

4.861.2.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map (const map< _Key, _Tp, _Compare, _Alloc > & *__x*) `[inline]`

Map copy constructor.

Parameters

__x	A map of identical element and allocator types.

The newly-created map uses a copy of the allocation object used by *__x*.

Definition at line 180 of file stl_map.h.

4.861.2.4 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map (map< _Key, _Tp, _Compare, _Alloc > && *__x*) [inline], [noexcept]

Map move constructor.

Parameters

__x	A map of identical element and allocator types.

The newly-created map contains the exact contents of *__x*. The contents of *__x* are a valid, but unspecified map.

Definition at line 191 of file stl_map.h.

4.861.2.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map (initializer_list< value_type > *__l*, const _Compare & *__comp* = _Compare(), const allocator_type & *__a* = allocator_type()) [inline]

Builds a map from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison object.
__a	An allocator object.

Create a map consisting of copies of the elements in the initializer_list *__l*. This is linear in N if the range is already sorted, and NlogN otherwise (where N is *__l.size()*).

Definition at line 206 of file stl_map.h.

4.861.2.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::map< _Key, _Tp, _Compare, _Alloc >::map (_InputIterator *__first*, _InputIterator *__last*) [inline]

Builds a map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a map consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 224 of file stl_map.h.

4.861.2.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::map< _Key, _Tp, _Compare, _Alloc >::map (_InputIterator *__first*, _InputIterator *__last*, const _Compare & *__comp*, const allocator_type & *__a* = allocator_type()) [inline]

Builds a map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a map consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 241 of file stl_map.h.

4.861.3 Member Function Documentation

4.861.3.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::map< _Key, _Tp, _Compare, _Alloc >::at (const key_type & __k) [inline]

Access to map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equivalent to *__k*, if such a data is present in the map.

Exceptions

std::out_of_range	If no such data is present.

Definition at line 501 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::end(), std::map< _Key, _Tp, _Compare, _Alloc >::key_comp(), and std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound().

4.861.3.2 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 320 of file stl_map.h.

4.861.3.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 329 of file stl_map.h.

4.861.3.4 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 393 of file stl_map.h.

4.861.3.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 402 of file stl_map.h.

4.861.3.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::map< _Key, _Tp, _Compare, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 787 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::operator=().

4.861.3.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::map< _Key, _Tp, _Compare, _Alloc >::count (const key_type & __x) const [inline]

Finds the number of elements with given key.

Parameters

__x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 847 of file stl_map.h.

4.861.3.8 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 411 of file stl_map.h.

4.861.3.9 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 420 of file stl_map.h.

4.861.3.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> std::pair<iterator, bool> std::map< _Key, _Tp, _Compare, _Alloc >::emplace (_Args &&... *__args*) [inline]

Attempts to build and insert a std::pair into the map.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 540 of file stl_map.h.

4.861.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint (const_iterator *__pos,* _Args &&... *__args*) [inline]

Attempts to build and insert a std::pair into the map.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args* (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 570 of file stl_map.h.

4.861.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> bool std::map< _Key, _Tp, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the map is empty. (Thus begin() would equal end().)

Definition at line 429 of file stl_map.h.

4.861.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::map< _Key, _Tp, _Compare, _Alloc >::end ( ) [inline], [noexcept]

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 338 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::at(), and std::map< _Key, _Tp, _Compare, _Alloc >::operator[]().

4.861.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 347 of file stl_map.h.

4.861.3.15 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, iterator> std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (const key_type & __x) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 916 of file stl_map.h.

4.861.3.16 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator> std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (const key_type & __x) const [inline]

Finds a subsequence matching given key.

Parameters

__x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 935 of file stl_map.h.

4.861.3.17 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (const_iterator *__position*) [inline]

Erases an element from a map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 690 of file stl_map.h.

4.861.3.18 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::map< _Key, _Tp, _Compare, _Alloc >::erase (const key_type & *__x*) [inline]

Erases elements according to the provided key.

Parameters

__x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 725 of file stl_map.h.

4.861.3.19 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (const_iterator *__first,* const_iterator *__last*) `[inline]`

Erases a [first,last) range of elements from a map.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 745 of file stl_map.h.

4.861.3.20 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (const key_type & *__x*) `[inline]`

Tries to locate an element in a map.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 820 of file stl_map.h.

4.861.3.21 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (const key_type & *__x*) const `[inline]`

Tries to locate an element in a map.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 835 of file stl_map.h.

4.861.3.22 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> allocator_type std::map< _Key, _Tp, _Compare, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Get a copy of the memory allocation object.

Definition at line 310 of file stl_map.h.

4.861.3.23 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, bool> std::map< _Key, _Tp, _Compare, _Alloc >::insert (const value_type & __x) [inline]

Attempts to insert a std::pair into the map.

Parameters

__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 594 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::operator=(), and std::map< _Key, _Tp, _Compare, _Alloc >::operator[]().

4.861.3.24 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::map< _Key, _Tp, _Compare, _Alloc >::insert (std::initializer_list< value_type > __list) [inline]

Attempts to insert a list of std::pairs into the map.

Parameters

__list	A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.

Definition at line 615 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::insert().

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::insert().

4.861.3.25 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator **std::map**< _Key, _Tp, _Compare, _Alloc >::insert (const_iterator *__position,* const **value_type** & *__x*) [inline]

Attempts to insert a std::pair into the map.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 644 of file stl_map.h.

4.861.3.26 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > void **std::map**< _Key, _Tp, _Compare, _Alloc >::insert (_InputIterator *__first,* _InputIterator *__last*) [inline]

Template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 670 of file stl_map.h.

4.861.3.27 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> key_compare **std::map**< _Key, _Tp, _Compare, _Alloc >::key_comp ( ) const [inline]

Returns the key comparison object out of which the map was constructed.

Definition at line 796 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::at(), and std::map< _Key, _Tp, _Compare, _Alloc >::operator[]().

4.861.3.28 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator **std::map**< _Key, _Tp, _Compare, _Alloc >::lower_bound (const key_type & *__x*) [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 862 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::at(), and std::map< _Key, _Tp, _Compare, _Alloc >::operator[]().

4.861.3.29 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (const key_type & *__x*) const [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 877 of file stl_map.h.

4.861.3.30 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the map.

Definition at line 439 of file stl_map.h.

4.861.3.31 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (const map< _Key, _Tp, _Compare, _Alloc > & *__x*) [inline]

Map assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

__x	A map of identical element and allocator types.

All the elements of *__x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 264 of file stl_map.h.

4.861.3.32 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (map< _Key, _Tp, _Compare, _Alloc > && __x) [inline]

Map move assignment operator.

Parameters

__x	A map of identical element and allocator types.

The contents of *__x* are moved into this map (without copying). *__x* is a valid, but unspecified map.

Definition at line 279 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::clear(), and std::map< _Key, _Tp, _Compare, _Alloc >::swap().

4.861.3.33 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (initializer_list< value_type > __l) [inline]

Map list assignment operator.

Parameters

__l	An initializer_list.

This function fills a map with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 300 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::clear(), and std::map< _Key, _Tp, _Compare, _Alloc >::insert().

4.861.3.34 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::map< _Key, _Tp, _Compare, _Alloc >::operator[] (const key_type & __k) [inline]

Subscript ([]) access to map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

Definition at line 456 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::end(), std::map< _Key, _Tp, _Compare, _Alloc >::insert(), std::map< _Key, _Tp, _Compare, _Alloc >::key_comp(), std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound(), and std::piecewise_construct.

4.861.3.35 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 356 of file stl_map.h.

4.861.3.36 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 365 of file stl_map.h.

4.861.3.37 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 374 of file stl_map.h.

4.861.3.38 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 383 of file stl_map.h.

4.861.3.39 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::map< _Key, _Tp, _Compare, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the map.

Definition at line 434 of file stl_map.h.

4.861.3.40 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::map< _Key, _Tp, _Compare, _Alloc >::swap (map< _Key, _Tp, _Compare, _Alloc > & __x) [inline]

Swaps data with another map.

Parameters

__x	A map of the same element and allocator types.

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

Definition at line 777 of file stl_map.h.

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::operator=(), and std::swap().

4.861.3.41 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (const key_type & __x) [inline]

Finds the end of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 887 of file stl_map.h.

4.861.3.42 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (const key_type & __x) const [inline]

Finds the end of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 897 of file stl_map.h.

4.861.3.43 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> value_compare std::map< _Key, _Tp, _Compare, _Alloc >::value_comp ( ) const [inline]

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

Definition at line 804 of file stl_map.h.

4.862.1 Detailed Description

template<class _Tp>class std::mask_array< _Tp >

Reference to selected subset of an array.

A mask_array is a reference to the actual elements of an array specified by a bitmask in the form of an array of bool. The way to get a mask_array is to call operator[](valarray<bool>) on a valarray. The returned mask_array then permits carrying operations out on the referenced subset of elements in the original valarray.

For example, if a mask_array is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to array[1] and array[3] in the underlying array.

Parameters

Tp	Element type.

Definition at line 62 of file mask_array.h.

The documentation for this class was generated from the following file:

- mask_array.h

4.863.1 Detailed Description

template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>class std::match_results< _Bi_iter, _Alloc >

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match_results.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The sub_match object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the sub_match member matched is always true. The sub_match object stored at index n denotes what matched the marked sub-expression n within the matched expression. If the sub-expression n participated in a regular expression match then the sub_match member matched evaluates to true, and members first and second denote the range of characters [first, second) which formed that match. Otherwise matched is false, and members first and second point to the end of the sequence that was searched.

Definition at line 1429 of file regex.h.

4.863.2 Constructor & Destructor Documentation

4.863.2.1 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter, _Alloc >::match_results (const _Alloc & *__a* = `_Alloc()`) `[inline]`, `[explicit]`

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

Definition at line 1478 of file regex.h.

Referenced by std::match_results< _FwdIterT, _Alloc >::operator=().

4.863.2.2 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter, _Alloc >::match_results (const match_results< _Bi_iter, _Alloc > & __rhs) [inline]

Copy constructs a match_results.

Definition at line 1485 of file regex.h.

4.863.2.3 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter, _Alloc >::match_results (match_results< _Bi_iter, _Alloc > && __rhs) [inline], [noexcept]

Move constructs a match_results.

Definition at line 1492 of file regex.h.

4.863.2.4 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter, _Alloc >::~match_results ( ) [inline]

Destroys a match_results object.

Definition at line 1519 of file regex.h.

4.863.3 Member Function Documentation

4.863.3.1 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator std::match_results< _Bi_iter, _Alloc >::begin ( ) const [inline]

Gets an iterator to the start of the sub_match collection.

Definition at line 1676 of file regex.h.

Referenced by std::operator==().

4.863.3.2 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator std::match_results< _Bi_iter, _Alloc >::cbegin ( ) const [inline]

Gets an iterator to the start of the sub_match collection.

Definition at line 1683 of file regex.h.

4.863.3.3 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator std::match_results< _Bi_iter, _Alloc >::cend ( ) const [inline]

Gets an iterator to one-past-the-end of the collection.

Definition at line 1697 of file regex.h.

4.863.3.4 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> bool std::match_results< _Bi_iter, _Alloc >::empty ( ) const [inline]

Indicates if the match_results contains no results.

Return values

true	The match_results object is empty.
false	The match_results object is not empty.

Definition at line 1563 of file regex.h.

Referenced by std::match_results< _FwdIterT, _Alloc >::end(), std::operator==(), std::match_results< _FwdIterT, _Alloc >::prefix(), and std::match_results< _FwdIterT, _Alloc >::suffix().

4.863.3.5 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator **std::match_results**< _Bi_iter, _Alloc >::end ( ) const `[inline]`

Gets an iterator to one-past-the-end of the collection.

Definition at line 1690 of file regex.h.

Referenced by std::match_results< _FwdIterT, _Alloc >::cend(), and std::operator==().

4.863.3.6 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> template<typename _Out_iter > _Out_iter **std::match_results**< _Bi_iter, _Alloc >::format (_Out_iter *__out,* const char_type ∗ *__fmt_first,* const char_type ∗ *__fmt_last,* match_flag_type *__flags* = **regex_constants::format_default**) const `[inline]`

Precondition

ready() == true

Todo Implement this function.

Definition at line 1718 of file regex.h.

Referenced by std::match_results< _FwdIterT, _Alloc >::format().

4.863.3.7 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> template<typename _Out_iter , typename _St , typename _Sa > _Out_iter **std::match_results**< _Bi_iter, _Alloc >::format (_Out_iter *__out,* const **basic_string**< char_type, _St, _Sa > & *__fmt,* match_flag_type *__flags* = **regex_constants::format_default**) const `[inline]`

Precondition

ready() == true

Definition at line 1728 of file regex.h.

4.863.3.8 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> template<typename _Out_iter , typename _St , typename _Sa > **basic_string**<char_type, _St, _Sa> **std::match_results**< _Bi_iter, _Alloc >::format (const **basic_string**< char_type, _St, _Sa > & *__fmt,* match_flag_type *__flags* = **regex_constants::format_default**) const `[inline]`

Precondition

ready() == true

Definition at line 1740 of file regex.h.

4.863.3.9 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> **string_type** **std::match_results**< _Bi_iter, _Alloc >::format (const char_type ∗ *__fmt,* match_flag_type *__flags* = **regex_constants::format_default**) const `[inline]`

Precondition

ready() == true

Definition at line 1752 of file regex.h.

4.863.3.10 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> allocator_type std::match_results< _Bi_iter, _Alloc >::get_allocator ( ) const [inline]

Gets a copy of the allocator.

Definition at line 1773 of file regex.h.

4.863.3.11 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> difference_type std::match_results< _Bi_iter, _Alloc >::length (size_type *__sub* = 0) const [inline]

Gets the length of the indicated submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

Definition at line 1582 of file regex.h.

4.863.3.12 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> size_type std::match_results< _Bi_iter, _Alloc >::max_size ( ) const [inline]

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or mark_count() + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1554 of file regex.h.

4.863.3.13 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results& std::match_results< _Bi_iter, _Alloc >::operator= (const match_results< _Bi_iter, _Alloc > & *__rhs*) [inline]

Assigns rhs to ∗this.

Definition at line 1500 of file regex.h.

4.863.3.14 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results& std::match_results< _Bi_iter, _Alloc >::operator= (match_results< _Bi_iter, _Alloc > && *__rhs*) [inline]

Move-assigns rhs to ∗this.

Definition at line 1510 of file regex.h.

4.863.3.15 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference std::match_results< _Bi_iter, _Alloc >::operator[] (size_type *__sub*) const [inline]

Gets a sub_match reference for the match or submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function gets a reference to the indicated submatch, or the entire match if ___`sub` is zero.

If ___`sub` >= size() then this function returns a sub_match with a special value indicating no submatch.

Definition at line 1630 of file regex.h.

4.863.3.16 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> difference_type std::match_results< _Bi_iter, _Alloc >::position (size_type *__sub* = 0) const [inline]

Gets the offset of the beginning of the indicated submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of ___`sub` is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

Returns -1 if ___`sub` is out of range.

Definition at line 1599 of file regex.h.

4.863.3.17 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference std::match_results< _Bi_iter, _Alloc >::prefix ( ) const [inline]

Gets a sub_match representing the match prefix.

Precondition

ready() == true

This function gets a reference to a sub_match object representing the part of the target range between the start of the target range and the start of the match.

Definition at line 1647 of file regex.h.

Referenced by std::operator==(), and std::match_results< _FwdIterT, _Alloc >::position().

4.863.3.18 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> bool std::match_results< _Bi_iter, _Alloc >::ready ( ) const [inline]

Indicates if the match_results is ready.

Return values

true	The object has a fully-established result state.
false	The object is not ready.

Definition at line 1530 of file regex.h.

Referenced by std::operator==(), std::match_results< _FwdIterT, _Alloc >::operator[ ](), std::match_results< _FwdIterT, _Alloc >::prefix(), and std::match_results< _FwdIterT, _Alloc >::suffix().

4.863.3.19 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> size_type std::match_results< _Bi_iter, _Alloc >::size ( ) const [inline]

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or mark_count() + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1547 of file regex.h.

Referenced by std::match_results< _FwdIterT, _Alloc >::empty(), std::operator==(), std::match_results< _FwdIterT, _Alloc >::operator[ ](), and std::match_results< _FwdIterT, _Alloc >::position().

4.863.3.20 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> string_type std::match_results< _Bi_iter, _Alloc >::str (size_type *__sub* = 0) const [inline]

Gets the match or submatch converted to a string type.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

Definition at line 1615 of file regex.h.

4.863.3.21 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference std::match_results< _Bi_iter, _Alloc >::suffix ( ) const [inline]

Gets a sub_match representing the match suffix.

Precondition

ready() == true

This function gets a reference to a sub_match object representing the part of the target range between the end of the match and the end of the target range.

Definition at line 1664 of file regex.h.

Referenced by std::operator==().

4.863.3.22 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> void **std::match_results**< _Bi_iter, _Alloc >::swap (**match_results**< _Bi_iter, _Alloc > & *__that*) [inline]

Swaps the contents of two match_results.

Definition at line 1787 of file regex.h.

Referenced by std::swap().

4.868.1 Detailed Description

template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined mt19937 class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

Template Parameters

__w	Word size, the number of bits in each element of the state vector.
__n	The degree of recursion.
__m	The period parameter.
__r	The separation point bit index.
__a	The last row of the twist matrix.
__u	The first right-shift tempering matrix parameter.
__d	The first right-shift tempering matrix mask.
__s	The first left-shift tempering matrix parameter.
__b	The first left-shift tempering matrix mask.
__t	The second left-shift tempering matrix parameter.
__c	The second left-shift tempering matrix mask.
__l	The second right-shift tempering matrix parameter.
__f	Initialization multiplier.

Definition at line 449 of file random.h.

4.868.2 Member Typedef Documentation

The type of the generated random value.

Definition at line 452 of file random.h.

4.868.3 Constructor & Destructor Documentation

4.868.3.1 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _Sseq , typename = typename std::enable_if<!std::is_same<_Sseq, mersenne_twister_engine>::value> ::type> std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::mersenne_twister_engine (_Sseq & *__q*) `[inline]`, `[explicit]`

Constructs a mersenne_twister_engine random number generator engine seeded from the seed sequence `__q`.

Parameters

__q	the seed sequence.

Definition at line 513 of file random.h.

4.868.4 Member Function Documentation

4.868.4.1 template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::discard (unsigned long long *__z*)

Discard a sequence of random numbers.

Definition at line 435 of file bits/random.tcc.

4.868.4.2 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::max ( ) `[inline]`, `[static]`

Gets the largest possible value in the output range.

Definition at line 534 of file random.h.

4.868.4.3 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::min ( ) `[inline]`, `[static]`

Gets the smallest possible value in the output range.

Definition at line 527 of file random.h.

4.868.5 Friends And Related Function Documentation

4.868.5.1 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & *__os*, const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & *__x*) `[friend]`

Inserts the current state of a % mersenne_twister_engine random number generator engine `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A % mersenne_twister_engine random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.868.5.2 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> bool operator== (const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & *__lhs*, const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & *__rhs*) [friend]

Compares two % mersenne_twister_engine random number generator objects of the same type for equality.

Parameters

__lhs	A % mersenne_twister_engine random number generator object.
__rhs	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 559 of file random.h.

4.868.5.3 template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & *__is*, std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & *__x*) [friend]

Extracts the current state of a % mersenne_twister_engine random number generator engine ___x from the input stream ___is.

Parameters

__is	An input stream.
__x	A % mersenne_twister_engine random number generator engine.

Returns

The input stream with the state of ___x extracted or in an error state.

4.869.1 Detailed Description

template<typename _CharT>class std::messages< _CharT >

Primary class template messages.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

Definition at line 1695 of file locale_facets_nonio.h.

4.869.2 Member Typedef Documentation

4.869.3 Constructor & Destructor Documentation

4.869.3.1 template<typename _CharT > std::messages< _CharT >::messages (size_t __refs = 0) [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 44 of file messages_members.h.

4.869.3.2 template<typename _CharT > std::messages< _CharT >::messages (__c_locale __cloc, const char * __s, size_t __refs = 0) [explicit]

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__s	The name of a locale.
__refs	Refcount to pass to the base class.

Definition at line 50 of file messages_members.h.

4.869.3.3 template<typename _CharT > std::messages< _CharT >::∼messages ( ) [protected], [virtual]

Destructor.

4.875.1 Detailed Description

template<typename _CharT, typename _InIter>class std::money_get< _CharT, _InIter >

Primary class template money_get.

This facet encapsulates the code to parse and return a monetary amount from a string.

The money_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the money_get facet.

Definition at line 1370 of file locale_facets_nonio.h.

4.875.3 Constructor & Destructor Documentation

4.875.3.1 template<typename _CharT , typename _InIter > **std::money_get**< _CharT, _InIter >::**money_get** (size_t *__refs* = 0) `[inline]`, `[explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 1392 of file locale_facets_nonio.h.

4.875.3.2 template<typename _CharT , typename _InIter > virtual **std::money_get**< _CharT, _InIter >::~**money_get** ( ) `[inline]`, `[protected]`, `[virtual]`

Destructor.

Definition at line 1460 of file locale_facets_nonio.h.

4.875.4 Member Function Documentation

4.875.4.1 template<typename _CharT , typename _InIter > _InIter **std::money_get**< _CharT, _InIter >::do_get (**iter_type** *__s*, **iter_type** *__end*, bool *__intl*, **ios_base** & *__io*, **ios_base::iostate** & *__err*, long double & *__units*) const `[protected]`, `[virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See Also

get() for details.

Definition at line 365 of file locale_facets_nonio.tcc.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str().

Referenced by std::money_get< _CharT, _InIter >::get().

4.875.4.2 template<typename _CharT , typename _InIter > _InIter std::money_get< _CharT, _InIter >::do_get (iter_type *__s,* iter_type *__end,* bool *__intl,* ios_base & *__io,* ios_base::iostate & *__err,* string_type & *__digits*) const [protected], [virtual]

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See Also

get() for details.

Definition at line 378 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::basic_string< _CharT, _Traits, _Alloc >::resize(), and std::__ctype_abstract_base< _CharT >::widen().

4.875.4.3 template<typename _CharT , typename _InIter > iter_type std::money_get< _CharT, _InIter >::get (iter_type *__s,* iter_type *__end,* bool *__intl,* ios_base & *__io,* ios_base::iostate & *__err,* long double & *__units*) const [inline]

Read and parse a monetary value.

This function reads characters from *__s*, interprets them as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and returns the result in *units* as an integral value moneypunct::frac_digits() ∗ the actual amount. For example, the string $10.01 in a US locale would store 1001 in *units*.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets err=(err|io.failbit). If the stream is consumed before finishing parsing, sets err=(err|io.failbit|io.eofbit). *units* is unchanged if parsing fails.

This function works by returning the result of do_get().

Parameters

__s	Start of characters to parse.
__end	End of characters to parse.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__err	Error field to set if parsing fails.
__units	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1422 of file locale_facets_nonio.h.

References std::money_get< _CharT, _InIter >::do_get().

4.875.4.4 template<typename _CharT , typename _InIter > **iter_type std::money_get< _CharT, _InIter >::get** (**iter_type** *__s,* **iter_type** *__end,* bool *__intl,* **ios_base &** *__io,* **ios_base::iostate &** *__err,* **string_type &** *__digits*) const `[inline]`

Read and parse a monetary value.

This function reads characters from *__s*, interprets them as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and returns the result in *digits*. For example, the string $10.01 in a US locale would store `1001` in *digits*.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets err=(err|io.failbit). If the stream is consumed before finishing parsing, sets err=(err|io.failbit|io.eofbit).

This function works by returning the result of do_get().

Parameters

__s	Start of characters to parse.
__end	End of characters to parse.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__err	Error field to set if parsing fails.
__digits	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1453 of file locale_facets_nonio.h.

4.876.4 Member Function Documentation

4.876.4.1 template<typename _CharT , typename _OutIter > _OutIter **std::money_put**< _CharT, _OutIter >::do_put (**iter_type** *__s*, bool *__intl*, **ios_base** & *__io*, **char_type** *__fill*, long double *__units*) const `[protected]`, `[virtual]`

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the value 1001 in a US locale would write `$10.01` to *__s*.

This function is a hook for derived classes to change the value returned.

See Also

put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.
__units	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 570 of file locale_facets_nonio.tcc.

References std::ios_base::getloc(), and std::__ctype_abstract_base< _CharT >::widen().

Referenced by std::money_put< _CharT, _OutIter >::put().

4.876.4.2 template<typename _CharT , typename _OutIter > _OutIter **std::money_put**< _CharT, _OutIter >::do_put (**iter_type** *__s*, bool *__intl*, **ios_base** & *__io*, **char_type** *__fill*, const **string_type** & *__digits*) const `[protected]`, `[virtual]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the string `1001` in a US locale would write `$10.01` to *__s*.

This function is a hook for derived classes to change the value returned.

See Also

put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.
__digits	Place to store result of parsing.

Returns

4.877.3 Constructor & Destructor Documentation

4.877.3.1 template<typename _CharT , bool _Intl> std::moneypunct< _CharT, _Intl >::moneypunct (size_t *__refs* = 0) [inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 963 of file locale_facets_nonio.h.

4.877.3.2 template<typename _CharT , bool _Intl> std::moneypunct< _CharT, _Intl >::moneypunct (__cache_type ∗ *__cache*, size_t *__refs* = 0) [inline], [explicit]

Constructor performs initialization.

This is an internal constructor.

Parameters

__cache	Cache for optimization.
__refs	Passed to the base facet class.

Definition at line 976 of file locale_facets_nonio.h.

4.877.3.3 template<typename _CharT , bool _Intl> std::moneypunct< _CharT, _Intl >::moneypunct (__c_locale *__cloc*, const char ∗ *__s*, size_t *__refs* = 0) [inline], [explicit]

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__s	The name of a locale.
__refs	Passed to the base facet class.

Definition at line 991 of file locale_facets_nonio.h.

4.877.3.4 template<typename _CharT , bool _Intl> virtual std::moneypunct< _CharT, _Intl >::∼moneypunct ( ) [protected], [virtual]

Destructor.

4.877.4 Member Function Documentation

4.877.4.1 template<typename _CharT , bool _Intl> string_type std::moneypunct< _CharT, _Intl >::curr_symbol ( ) const [inline]

Return currency symbol string.

This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

Definition at line 1061 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_curr_symbol().

4.877.4.2 template<typename _CharT , bool _Intl> char_type std::moneypunct< _CharT, _Intl >::decimal_point ( ) const [inline]

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_type>::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1005 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_decimal_point().

4.877.4.3 template<typename _CharT , bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol ( ) const [inline], [protected], [virtual]

Return currency symbol string.

This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See Also

curr_symbol() for details.

Returns

string_type representing a currency symbol.

Definition at line 1207 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::curr_symbol().

4.877.4.4 template<typename _CharT , bool _Intl> virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point ( ) const [inline], [protected], [virtual]

Return decimal point character.

Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1169 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::decimal_point().

4.877.4.5 template<typename _CharT , bool _Intl> virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits ( ) const [inline], [protected], [virtual]

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See Also

frac_digits() for details.

Returns

Number of digits in amount fraction.

Definition at line 1247 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::frac_digits().

4.877.4.6 template<typename _CharT , bool _Intl> virtual string std::moneypunct< _CharT, _Intl >::do_grouping ( ) const [inline], [protected], [virtual]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See Also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1194 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::grouping().

4.877.4.7 template<typename _CharT , bool _Intl> virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format ( ) const [inline], [protected], [virtual]

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See Also

neg_format() for details.

Returns

Pattern for money values.

Definition at line 1275 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::neg_format().

4.877.4.8 template<typename _CharT , bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign ( ) const [inline], [protected], [virtual]

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See Also

negative_sign() for details.

Returns

string_type representing a negative sign.

Definition at line 1233 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::negative_sign().

4.877.4.9 template<typename _CharT , bool _Intl> virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format ( ) const [inline], [protected], [virtual]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See Also

pos_format() for details.

Returns

Pattern for money values.

Definition at line 1261 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::pos_format().

4.877.4.10 template<typename _CharT , bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign ( ) const [inline], [protected], [virtual]

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See Also

positive_sign() for details.

Returns

string_type representing a positive sign.

Definition at line 1220 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::positive_sign().

4.877.4.11 template<typename _CharT , bool _Intl> virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep ( ) const [inline], [protected], [virtual]

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1181 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::thousands_sep().

4.877.4.12 template<typename _CharT , bool _Intl> int std::moneypunct< _CharT, _Intl >::frac_digits ( ) const [inline]

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char_type>::do_frac_digits().

The fractional part of a money amount is optional. But if it is present, there must be frac_digits() digits.

Returns

Number of digits in amount fraction.

Definition at line 1111 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_frac_digits().

4.877.4.13 template<typename _CharT , bool _Intl> string std::moneypunct< _CharT, _Intl >::grouping ( ) const `[inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling moneypunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1048 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_grouping().

4.877.4.14 template<typename _CharT , bool _Intl> pattern std::moneypunct< _CharT, _Intl >::neg_format ( ) const `[inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1151 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_neg_format().

4.877.4.15 template<typename _CharT , bool _Intl> string_type std::moneypunct< _CharT, _Intl >::negative_sign ( ) const `[inline]`

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char_type>::do_negative_sign().

If the return value contains more than one character, the first character appears in the position indicated by neg_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1095 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_negative_sign().

4.877.4.16 template<typename _CharT , bool _Intl> pattern std::moneypunct< _CharT, _Intl >::pos_format ( ) const [inline]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1147 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_pos_format().

4.877.4.17 template<typename _CharT , bool _Intl> string_type std::moneypunct< _CharT, _Intl >::positive_sign ( ) const [inline]

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. It does so by returning returning moneypunct<char_type>::do_positive_sign().

If the return value contains more than one character, the first character appears in the position indicated by pos_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1078 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_positive_sign().

4.877.4.18 template<typename _CharT , bool _Intl> char_type std::moneypunct< _CharT, _Intl >::thousands_sep ( ) const [inline]

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning moneypunct<char-_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1018 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_thousands_sep().

4.878.1 Detailed Description

template<typename _CharT, bool _Intl>class std::moneypunct_byname< _CharT, _Intl >

class moneypunct_byname [22.2.6.4].

Definition at line 1324 of file locale_facets_nonio.h.

4.878.2 Member Function Documentation

4.878.2.1 template<typename _CharT , bool _Intl> string_type std::moneypunct< _CharT, _Intl >::curr_symbol ( ) const [inline], [inherited]

Return currency symbol string.

This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

Definition at line 1061 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_curr_symbol().

4.878.2.2 template<typename _CharT , bool _Intl> char_type std::moneypunct< _CharT, _Intl >::decimal_point ( ) const [inline], [inherited]

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_type>::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1005 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_decimal_point().

4.878.2.3 template<typename _CharT , bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol ( ) const [inline], [protected], [virtual], [inherited]

Return currency symbol string.

This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See Also

curr_symbol() for details.

Returns

string_type representing a currency symbol.

Definition at line 1207 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::curr_symbol().

4.878.2.4 template<typename _CharT , bool _Intl> virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point ( ) const [inline], [protected], [virtual], [inherited]

Return decimal point character.

Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1169 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::decimal_point().

4.878.2.5 template<typename _CharT , bool _Intl> virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits ( ) const [inline], [protected], [virtual], [inherited]

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See Also

frac_digits() for details.

Returns

Number of digits in amount fraction.

Definition at line 1247 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::frac_digits().

4.878.2.6 template<typename _CharT , bool _Intl> virtual string std::moneypunct< _CharT, _Intl >::do_grouping ( ) const [inline], [protected], [virtual], [inherited]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See Also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1194 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::grouping().

4.878.2.7 template<typename _CharT , bool _Intl> virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format ( ) const [inline], [protected], [virtual], [inherited]

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See Also

neg_format() for details.

Returns

Pattern for money values.

Definition at line 1275 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::neg_format().

4.878.2.8 template<typename _CharT , bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign ( ) const [inline], [protected], [virtual], [inherited]

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See Also

negative_sign() for details.

Returns

string_type representing a negative sign.

Definition at line 1233 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::negative_sign().

4.878.2.9 template<typename _CharT , bool _Intl> virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format ( ) const [inline], [protected], [virtual], [inherited]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See Also

pos_format() for details.

Returns

Pattern for money values.

Definition at line 1261 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::pos_format().

4.878.2.10 template<typename _CharT , bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign ( ) const [inline], [protected], [virtual], [inherited]

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See Also

positive_sign() for details.

Returns

string_type representing a positive sign.

Definition at line 1220 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::positive_sign().

4.878.2.11 template<typename _CharT , bool _Intl> virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep ( ) const [inline], [protected], [virtual], [inherited]

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1181 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::thousands_sep().

4.878.2.12 template<typename _CharT , bool _Intl> int std::moneypunct< _CharT, _Intl >::frac_digits ( ) const [inline], [inherited]

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char_type>::do_frac_digits().

The fractional part of a money amount is optional. But if it is present, there must be frac_digits() digits.

Returns

Number of digits in amount fraction.

Definition at line 1111 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_frac_digits().

4.878.2.13 template<typename _CharT , bool _Intl> string std::moneypunct< _CharT, _Intl >::grouping ( ) const [inline], [inherited]

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling moneypunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1048 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_grouping().

4.878.2.14 template<typename _CharT , bool _Intl> pattern std::moneypunct< _CharT, _Intl >::neg_format ( ) const [inline], [inherited]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1151 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_neg_format().

4.878.2.15 template<typename _CharT , bool _Intl> string_type std::moneypunct< _CharT, _Intl >::negative_sign ( ) const [inline], [inherited]

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char_type>::do_negative_sign().

If the return value contains more than one character, the first character appears in the position indicated by neg_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1095 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_negative_sign().

4.878.2.16 template<typename _CharT , bool _Intl> pattern std::moneypunct< _CharT, _Intl >::pos_format ( ) const [inline], [inherited]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

4.879.1 Detailed Description

template<typename _Iterator>class std::move_iterator< _Iterator >

Class template move_iterator is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

Definition at line 930 of file stl_iterator.h.

4.880.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>class std::multimap< _Key, _Tp, _Compare, _Alloc >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>.

Meets the requirements of a `container`, a `reversible container`, and an `associative container` (using equivalent keys). For a `multimap<Key,T>` the key_type is Key, the mapped_type is T, and the value_type is std::pair<const Key,T>.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for map and multimap; the distinction is made entirely in how the tree functions are called (∗_unique versus ∗_equal, same as the standard).

Definition at line 95 of file stl_multimap.h.

4.880.2 Constructor & Destructor Documentation

4.880.2.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> **std::multimap**< _Key, _Tp, _Compare, _Alloc >::**multimap** ( ) `[inline]`

Default constructor creates no elements.

Definition at line 157 of file stl_multimap.h.

4.880.2.2 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> **std::multimap**< _Key, _Tp, _Compare, _Alloc >::**multimap** (const _Compare & *__comp*, const allocator_type & *__a* = `allocator_type()`) `[inline]`, `[explicit]`

Creates a multimap with no elements.

Parameters

__comp	A comparison object.
__a	An allocator object.

Definition at line 166 of file stl_multimap.h.

4.880.2.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> **std::multimap**< _Key, _Tp, _Compare, _Alloc >::**multimap** (const **multimap**< _Key, _Tp, _Compare, _Alloc > & *__x*) `[inline]`

Multimap copy constructor.

Parameters

__x	A multimap of identical element and allocator types.

The newly-created multimap uses a copy of the allocation object used by *__x*.

Definition at line 177 of file stl_multimap.h.

4.880.2.4 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> **std::multimap**< _Key, _Tp, _Compare, _Alloc >::**multimap** (**multimap**< _Key, _Tp, _Compare, _Alloc > && *__x*) `[inline]`, `[noexcept]`

Multimap move constructor.

Parameters

__x	A multimap of identical element and allocator types.

The newly-created multimap contains the exact contents of *__x*. The contents of *__x* are a valid, but unspecified multimap.

Definition at line 188 of file stl_multimap.h.

4.880.2.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> **std::multimap**< _Key, _Tp, _Compare, _Alloc >::**multimap** (**initializer_list**< **value_type** > *__l*, const _Compare & *__comp* = `_Compare()`, const allocator_type & *__a* = `allocator_type()`) `[inline]`

Builds a multimap from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a multimap consisting of copies of the elements from the initializer_list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).

Definition at line 202 of file stl_multimap.h.

4.880.2.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (_InputIterator *__first*, _InputIterator *__last*) `[inline]`

Builds a multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a multimap consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 219 of file stl_multimap.h.

4.880.2.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (_InputIterator *__first*, _InputIterator *__last*, const _Compare & *__comp*, const allocator_type & *__a* = `allocator_type()`) `[inline]`

Builds a multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a multimap consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 235 of file stl_multimap.h.

4.880.3 Member Function Documentation

4.880.3.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ( ) `[inline]`, `[noexcept]`

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 314 of file stl_multimap.h.

4.880.3.2 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 323 of file stl_multimap.h.

4.880.3.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 387 of file stl_multimap.h.

4.880.3.4 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 396 of file stl_multimap.h.

4.880.3.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::multimap< _Key, _Tp, _Compare, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 696 of file stl_multimap.h.

Referenced by std::multimap< _Key, _Tp, _Compare, _Alloc >::operator=().

4.880.3.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::count (const key_type & __x) const [inline]

Finds the number of elements with given key.

Parameters

__x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

Definition at line 753 of file stl_multimap.h.

4.880.3.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 405 of file stl_multimap.h.

4.880.3.8 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 414 of file stl_multimap.h.

4.880.3.9 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace (_Args &&... *__args*) [inline]

Build and insert a std::pair into the multimap.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 454 of file stl_multimap.h.

4.880.3.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace_hint (const_iterator *__pos*, _Args &&... *__args*) [inline]

Builds and inserts a std::pair into the multimap.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html`

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 481 of file stl_multimap.h.

4.880.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> bool std::multimap< _Key, _Tp, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the multimap is empty.

Definition at line 421 of file stl_multimap.h.

4.880.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end ( ) [inline], [noexcept]

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 332 of file stl_multimap.h.

4.880.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 341 of file stl_multimap.h.

4.880.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, iterator> std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (const key_type & __x) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 820 of file stl_multimap.h.

4.880.3.15 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator> std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (const key_type & __x) const [inline]

Finds a subsequence matching given key.

Parameters

__x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 837 of file stl_multimap.h.

4.880.3.16 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (const_iterator __position) [inline]

Erases an element from a multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 595 of file stl_multimap.h.

4.880.3.17 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (const key_type & __x) [inline]

Erases elements according to the provided key.

Parameters

__x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 630 of file stl_multimap.h.

4.880.3.18 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (const_iterator *__first,* const_iterator *__last*) [inline]

Erases a [first,last) range of elements from a multimap.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased .

Returns

The iterator __*last*.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 651 of file stl_multimap.h.

4.880.3.19 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (const key_type & *__x*) [inline]

Tries to locate an element in a multimap.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 729 of file stl_multimap.h.

4.880.3.20 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (const key_type & *__x*) const [inline]

Tries to locate an element in a multimap.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 744 of file stl_multimap.h.

4.880.3.21 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> allocator_type std::multimap< _Key, _Tp, _Compare, _Alloc >::get_allocator ( ) const `[inline]`, `[noexcept]`

Get a copy of the memory allocation object.

Definition at line 304 of file stl_multimap.h.

4.880.3.22 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (const value_type & __x) `[inline]`

Inserts a std::pair into the multimap.

Parameters

__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 501 of file stl_multimap.h.

Referenced by std::multimap< _Key, _Tp, _Compare, _Alloc >::operator=().

4.880.3.23 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (const_iterator __position, const value_type & __x) `[inline]`

Inserts a std::pair into the multimap.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 535 of file stl_multimap.h.

4.880.3.24 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > void **std::multimap**< _Key, _Tp, _Compare, _Alloc >::insert (_InputIterator *__first*, _InputIterator *__last*) [inline]

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 562 of file stl_multimap.h.

4.880.3.25 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void **std::multimap**< _Key, _Tp, _Compare, _Alloc >::insert (**initializer_list< value_type >** *__l*) [inline]

Attempts to insert a list of std::pairs into the multimap.

Parameters

__l	A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.

Definition at line 574 of file stl_multimap.h.

References std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

Referenced by std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

4.880.3.26 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> key_compare **std::multimap**< _Key, _Tp, _Compare, _Alloc >::key_comp ( ) const [inline]

Returns the key comparison object out of which the multimap was constructed.

Definition at line 705 of file stl_multimap.h.

4.880.3.27 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator **std::multimap**< _Key, _Tp, _Compare, _Alloc >::lower_bound (const key_type & *__x*) [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 768 of file stl_multimap.h.

4.880.3.28 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (const key_type & __x) const [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

Definition at line 783 of file stl_multimap.h.

4.880.3.29 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the multimap.

Definition at line 431 of file stl_multimap.h.

4.880.3.30 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (const multimap< _Key, _Tp, _Compare, _Alloc > & __x) [inline]

Multimap assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

__x	A multimap of identical element and allocator types.

All the elements of *__x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 258 of file stl_multimap.h.

4.880.3.31 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (multimap< _Key, _Tp, _Compare, _Alloc > && __x) [inline]

Multimap move assignment operator.

Parameters

__x	A multimap of identical element and allocator types.

The contents of *__x* are moved into this multimap (without copying). *__x* is a valid, but unspecified multimap.

Definition at line 273 of file stl_multimap.h.

References std::multimap< _Key, _Tp, _Compare, _Alloc >::clear(), and std::multimap< _Key, _Tp, _Compare, _Alloc >::swap().

4.880.3.32 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (initializer_list< value_type > __l) [inline]

Multimap list assignment operator.

Parameters

__l	An initializer_list.

This function fills a multimap with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 294 of file stl_multimap.h.

References std::multimap< _Key, _Tp, _Compare, _Alloc >::clear(), and std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

4.880.3.33 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 350 of file stl_multimap.h.

4.880.3.34 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 359 of file stl_multimap.h.

4.880.3.35 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 368 of file stl_multimap.h.

4.880.3.36 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 377 of file stl_multimap.h.

4.880.3.37 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the multimap.

Definition at line 426 of file stl_multimap.h.

4.880.3.38 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::multimap< _Key, _Tp, _Compare, _Alloc >::swap (multimap< _Key, _Tp, _Compare, _Alloc > & __x) [inline]

Swaps data with another multimap.

Parameters

__x	A multimap of the same element and allocator types.

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

Definition at line 686 of file stl_multimap.h.

Referenced by std::multimap< _Key, _Tp, _Compare, _Alloc >::operator=(), and std::swap().

4.880.3.39 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (const key_type & __x) [inline]

Finds the end of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 793 of file stl_multimap.h.

4.880.3.40 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator **std::multimap**< _Key, _Tp, _Compare, _Alloc >::upper_bound (const key_type & __x) const `[inline]`

Finds the end of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 803 of file stl_multimap.h.

4.880.3.41 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> value_compare **std::multimap**< _Key, _Tp, _Compare, _Alloc >::value_comp ( ) const `[inline]`

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

Definition at line 713 of file stl_multimap.h.

4.882.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>class std::multiset< _Key, _Compare, _Alloc >

A standard container made up of elements, which can be retrieved in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, a `reversible container`, and an `associative container` (using equivalent keys). For a `multiset<Key>` the key_type and value_type are Key.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (∗_unique versus ∗_equal, same as the standard).

Definition at line 92 of file stl_multiset.h.

4.882.2 Constructor & Destructor Documentation

4.882.2.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::multiset< _Key, _Compare, _Alloc >::multiset ( ) [inline]

Default constructor creates no elements.

Definition at line 137 of file stl_multiset.h.

4.882.2.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::multiset< _Key, _Compare, _Alloc >::multiset (const _Compare & *__comp*, const allocator_type & *__a* = allocator_type()) [inline], [explicit]

Creates a multiset with no elements.

Parameters

__comp	Comparator to use.
__a	An allocator object.

Definition at line 146 of file stl_multiset.h.

4.882.2.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset (_InputIterator *__first*, _InputIterator *__last*) [inline]

Builds a multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 160 of file stl_multiset.h.

4.882.2.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset (_InputIterator *__first*, _InputIterator *__last*, const _Compare & *__comp*, const allocator_type & *__a* = allocator_type()) [inline]

Builds a multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a multiset consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 176 of file stl_multiset.h.

4.882.2.5 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::multiset< _Key, _Compare, _Alloc >::multiset (const multiset< _Key, _Compare, _Alloc > & __x) [inline]

Multiset copy constructor.

Parameters

__x	A multiset of identical element and allocator types.

The newly-created multiset uses a copy of the allocation object used by *__x*.

Definition at line 189 of file stl_multiset.h.

4.882.2.6 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::multiset< _Key, _Compare, _Alloc >::multiset (multiset< _Key, _Compare, _Alloc > && __x) [inline], [noexcept]

Multiset move constructor.

Parameters

__x	A multiset of identical element and allocator types.

The newly-created multiset contains the exact contents of *__x*. The contents of *__x* are a valid, but unspecified multiset.

Definition at line 200 of file stl_multiset.h.

4.882.2.7 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::multiset< _Key, _Compare, _Alloc >::multiset (initializer_list< value_type > __l, const _Compare & __comp = _Compare(), const allocator_type & __a = allocator_type()) [inline]

Builds a multiset from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).

Definition at line 214 of file stl_multiset.h.

4.882.3 Member Function Documentation

4.882.3.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 295 of file stl_multiset.h.

4.882.3.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 332 of file stl_multiset.h.

4.882.3.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 341 of file stl_multiset.h.

4.882.3.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void std::multiset< _Key, _Compare, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 614 of file stl_multiset.h.

Referenced by std::multiset< _Key, _Compare, _Alloc >::operator=().

4.882.3.5 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::multiset< _Key, _Compare, _Alloc >::count (const key_type & __x) const [inline]

Finds the number of elements with given key.

Parameters

__x	Key of elements to be located.

Returns

Number of elements with specified key.

Definition at line 625 of file stl_multiset.h.

4.882.3.6 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 350 of file stl_multiset.h.

4.882.3.7 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 359 of file stl_multiset.h.

4.882.3.8 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename... _Args> iterator std::multiset< _Key, _Compare, _Alloc >::emplace (_Args &&... __args) [inline]

Builds and inserts an element into the multiset.

Parameters

__args	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 409 of file stl_multiset.h.

4.882.3.9 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename... _Args> iterator std::multiset< _Key, _Compare, _Alloc >::emplace_hint (const_iterator __pos, _Args &&... __args) [inline]

Builds and inserts an element into the multiset.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 435 of file stl_multiset.h.

4.882.3.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> bool std::multiset< _Key, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the set is empty.

Definition at line 365 of file stl_multiset.h.

4.882.3.11 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 304 of file stl_multiset.h.

4.882.3.12 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::pair<iterator, iterator> std::multiset< _Key, _Compare, _Alloc >::equal_range (const key_type & __x) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 705 of file stl_multiset.h.

4.882.3.13 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::pair<const_iterator, const_iterator> std::multiset< _Key, _Compare, _Alloc >::equal_range (const key_type & __x) const [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 709 of file stl_multiset.h.

4.882.3.14 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::erase (const_iterator __position) [inline]

Erases an element from a multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 536 of file stl_multiset.h.

4.882.3.15 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::multiset< _Key, _Compare, _Alloc >::erase (const key_type & __x) [inline]

Erases elements according to the provided key.

Parameters

__x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 566 of file stl_multiset.h.

4.882.3.16 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::erase (const_iterator __first, const_iterator __last) [inline]

Erases a [first,last) range of elements from a multiset.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 587 of file stl_multiset.h.

4.882.3.17 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator **std::multiset**< _Key, _Compare, _Alloc >::find (const key_type & *__x*) [inline]

Tries to locate an element in a set.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 643 of file stl_multiset.h.

4.882.3.18 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> const_iterator **std::multiset**< _Key, _Compare, _Alloc >::find (const key_type & *__x*) const [inline]

Tries to locate an element in a set.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 647 of file stl_multiset.h.

4.882.3.19 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> allocator_type **std::multiset**< _Key, _Compare, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Returns the memory allocation object.

Definition at line 286 of file stl_multiset.h.

4.882.3.20 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator **std::multiset**< _Key, _Compare, _Alloc >::insert (const value_type & *__x*) [inline]

Inserts an element into the multiset.

Parameters

__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 454 of file stl_multiset.h.

Referenced by std::multiset< _Key, _Compare, _Alloc >::operator=().

4.882.3.21 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator **std::multiset**< _Key, _Compare, _Alloc >::insert (const_iterator *__position,* const value_type & *__x*) [inline]

Inserts an element into the multiset.

Parameters

__position	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 484 of file stl_multiset.h.

4.882.3.22 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename _InputIterator > void **std::multiset**< _Key, _Compare, _Alloc >::insert (_InputIterator *__first,* _InputIterator *__last*) [inline]

A template function that tries to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 503 of file stl_multiset.h.

4.882.3.23 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void **std::multiset**< _Key, _Compare, _Alloc >::insert (**initializer_list**< value_type > *__l*) [inline]

Attempts to insert a list of elements into the multiset.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 515 of file stl_multiset.h.

References std::multiset< _Key, _Compare, _Alloc >::insert().

Referenced by std::multiset< _Key, _Compare, _Alloc >::insert().

4.882.3.24 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp ( ) const [inline]

Returns the comparison object.

Definition at line 278 of file stl_multiset.h.

4.882.3.25 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (const key_type & __x) [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 664 of file stl_multiset.h.

4.882.3.26 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (const key_type & __x) const [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 668 of file stl_multiset.h.

4.882.3.27 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::multiset< _Key, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the set.

Definition at line 375 of file stl_multiset.h.

4.882.3.28 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (const multiset< _Key, _Compare, _Alloc > & __x) [inline]

Multiset assignment operator.

Parameters

__x	A multiset of identical element and allocator types.

All the elements of *__x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 229 of file stl_multiset.h.

4.882.3.29 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (multiset< _Key, _Compare, _Alloc > && __x) [inline]

Multiset move assignment operator.

Parameters

__x	A multiset of identical element and allocator types.

The contents of *__x* are moved into this multiset (without copying). *__x* is a valid, but unspecified multiset.

Definition at line 245 of file stl_multiset.h.

References std::multiset< _Key, _Compare, _Alloc >::clear(), and std::multiset< _Key, _Compare, _Alloc >::swap().

4.882.3.30 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (initializer_list< value_type > __l) [inline]

Multiset list assignment operator.

Parameters

__l	An initializer_list.

This function fills a multiset with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 266 of file stl_multiset.h.

References std::multiset< _Key, _Compare, _Alloc >::clear(), and std::multiset< _Key, _Compare, _Alloc >::insert().

4.882.3.31 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 313 of file stl_multiset.h.

4.882.3.32 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend ( ) const `[inline]`, `[noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 322 of file stl_multiset.h.

4.882.3.33 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::multiset< _Key, _Compare, _Alloc >::size ( ) const `[inline]`, `[noexcept]`

Returns the size of the set.

Definition at line 370 of file stl_multiset.h.

4.882.3.34 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void std::multiset< _Key, _Compare, _Alloc >::swap (multiset< _Key, _Compare, _Alloc > & __x) `[inline]`

Swaps data with another multiset.

Parameters

__x	A multiset of the same element and allocator types.

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

Definition at line 390 of file stl_multiset.h.

Referenced by std::multiset< _Key, _Compare, _Alloc >::operator=(), and std::swap().

4.882.3.35 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (const key_type & __x) `[inline]`

Finds the end of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 680 of file stl_multiset.h.

4.882.3.36 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (const key_type & __x) const `[inline]`

Finds the end of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 684 of file stl_multiset.h.

4.882.3.37 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> value_compare **std::multiset**< _Key, _Compare, _Alloc >::value_comp ( ) const [inline]

Returns the comparison object.

Definition at line 282 of file stl_multiset.h.

4.885.1 Detailed Description

template<typename _IntType = int>class std::negative_binomial_distribution< _IntType >

A negative_binomial_distribution random number distribution.

The formula for the negative binomial probability mass function is $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.

Definition at line 4207 of file random.h.

4.885.2 Member Typedef Documentation

4.885.2.1 template<typename _IntType = int> typedef _IntType std::negative_binomial_distribution< _IntType >::result_type

The type of the range of the distribution.

Definition at line 4210 of file random.h.

4.885.3 Member Function Documentation

4.885.3.1 template<typename _IntType = int> _IntType std::negative_binomial_distribution< _IntType >::k ( ) const [inline]

Return the k parameter of the distribution.

Definition at line 4265 of file random.h.

4.885.3.2 template<typename _IntType = int> result_type std::negative_binomial_distribution< _IntType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 4301 of file random.h.

References std::numeric_limits< _Tp >::max().

4.885.3.3 template<typename _IntType = int> result_type std::negative_binomial_distribution< _IntType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 4294 of file random.h.

4.885.3.4 template<typename _IntType > template<typename _UniformRandomNumberGenerator > negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & *__urng*)

Generating functions.

Definition at line 1278 of file bits/random.tcc.

4.885.3.5 template<typename _IntType = int> double std::negative_binomial_distribution< _IntType >::p ( ) const [inline]

Return the p parameter of the distribution.

Definition at line 4272 of file random.h.

4.885.3.6 template<typename _IntType = int> param_type std::negative_binomial_distribution< _IntType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 4279 of file random.h.

4.885.3.7 template<typename _IntType = int> void std::negative_binomial_distribution< _IntType >::param (const param_type & __param) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 4287 of file random.h.

4.885.3.8 template<typename _IntType = int> void std::negative_binomial_distribution< _IntType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 4258 of file random.h.

References std::gamma_distribution< _RealType >::reset().

4.885.4 Friends And Related Function Documentation

4.885.4.1 template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::negative_binomial_distribution< _IntType1 > & __x) [friend]

Inserts a negative_binomial_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A negative_binomial_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.885.4.2 template<typename _IntType = int> bool operator== (const negative_binomial_distribution< _IntType > & *__d1*, const negative_binomial_distribution< _IntType > & *__d2*) [friend]

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4350 of file random.h.

4.885.4.3 template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & *__is*, std::negative_binomial_distribution< _IntType1 > & *__x*) [friend]

Extracts a negative_binomial_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A negative_binomial_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.888.1 Detailed Description

template<typename _RealType = double>class std::normal_distribution< _RealType >

A normal continuous distribution for random numbers.

The formula for the normal probability density function is

$$p(x|\mu,\sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu^2}{2\sigma^2}}$$

Definition at line 2085 of file random.h.

4.888.2 Member Typedef Documentation

4.888.2.1 template<typename _RealType = double> typedef _RealType std::normal_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 2088 of file random.h.

4.888.3 Constructor & Destructor Documentation

4.888.3.1 template<typename _RealType = double> std::normal_distribution< _RealType >::normal_distribution (result_type *__mean* = result_type `(0)`, result_type *__stddev* = result_type `(1)`) `[inline]`, `[explicit]`

Constructs a normal distribution with parameters $mean$ and standard deviation.

Definition at line 2130 of file random.h.

4.888.4 Member Function Documentation

4.888.4.1 template<typename _RealType = double> result_type std::normal_distribution< _RealType >::max ( ) const `[inline]`

Returns the least upper bound value of the distribution.

Definition at line 2187 of file random.h.

4.888.4.2 template<typename _RealType = double> _RealType std::normal_distribution< _RealType >::mean ( ) const `[inline]`

Returns the mean of the distribution.

Definition at line 2151 of file random.h.

4.888.4.3 template<typename _RealType = double> result_type std::normal_distribution< _RealType >::min ( ) const `[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2180 of file random.h.

4.888.4.4 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::normal_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

Definition at line 2195 of file random.h.

Referenced by std::normal_distribution< result_type >::operator()().

4.888.4.5 template<typename _RealType > template<typename _UniformRandomNumberGenerator > normal_distribution< _RealType >::result_type std::normal_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*, const param_type & *__param*)

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

Definition at line 1933 of file bits/random.tcc.

References std::log(), and std::sqrt().

4.888.4.6 template<typename _RealType = double> param_type std::normal_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 2165 of file random.h.

4.888.4.7 template<typename _RealType = double> void std::normal_distribution< _RealType >::param (const param_type & *__param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 2173 of file random.h.

4.888.4.8 template<typename _RealType = double> void std::normal_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 2144 of file random.h.

Referenced by std::lognormal_distribution< _RealType >::reset(), std::gamma_distribution< result_type >::reset(), std::student_t_distribution< _RealType >::reset(), std::binomial_distribution< _IntType >::reset(), and std::poisson_distribution< _IntType >::reset().

4.888.4.9 template<typename _RealType = double> _RealType std::normal_distribution< _RealType >::stddev ( ) const [inline]

Returns the standard deviation of the distribution.

Definition at line 2158 of file random.h.

4.888.5 Friends And Related Function Documentation

4.888.5.1 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::normal_distribution< _RealType1 > & __x) [friend]

Inserts a normal_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A normal_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.888.5.2 template<typename _RealType = double> template<typename _RealType1 > bool operator== (const std::normal_distribution< _RealType1 > & __d1, const std::normal_distribution< _RealType1 > & __d2) [friend]

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

4.888.5.3 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & __is, std::normal_distribution< _RealType1 > & __x) [friend]

Extracts a normal_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A normal_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.891.1 Detailed Description

template<typename _CharT, typename _InIter>class std::num_get< _CharT, _InIter >

Primary class template num_get.

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

The num_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_get facet.

Definition at line 1915 of file locale_facets.h.

4.891.2 Member Typedef Documentation

4.891.2.1 template<typename _CharT , typename _InIter > typedef _CharT std::num_get< _CharT, _InIter >::char_type

Public typedefs.

Definition at line 1921 of file locale_facets.h.

4.891.2.2 template<typename _CharT , typename _InIter > typedef _InIter std::num_get< _CharT, _InIter >::iter_type

Public typedefs.

Definition at line 1922 of file locale_facets.h.

4.891.3 Constructor & Destructor Documentation

4.891.3.1 template<typename _CharT , typename _InIter > std::num_get< _CharT, _InIter >::num_get (size_t *__refs* = 0) [inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 1936 of file locale_facets.h.

4.891.3.2 template<typename _CharT , typename _InIter > virtual std::num_get< _CharT, _InIter >::∼num_get ( ) [inline], [protected], [virtual]

Destructor.

Definition at line 2108 of file locale_facets.h.

4.891.4 Member Function Documentation

4.891.4.1 template<typename _CharT , typename _InIter > _InIter std::num_get< _CharT, _InIter >::do_get (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, bool & __v) const [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 590 of file locale_facets.tcc.

References std::ios_base::_M_getloc(), std::ios_base::boolalpha, std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::flags(), and std::ios_base::goodbit.

4.891.4.2 template<typename _CharT , typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, long & __v) const [inline], [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2176 of file locale_facets.h.

4.891.4.3 template<typename _CharT , typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (iter_type *__beg*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, unsigned short & *__v*) const `[inline]`, `[protected]`, `[virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2181 of file locale_facets.h.

4.891.4.4 template<typename _CharT , typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (iter_type *__beg*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, unsigned int & *__v*) const `[inline]`, `[protected]`, `[virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2186 of file locale_facets.h.

4.891.4.5 template<typename _CharT , typename _InIter > virtual **iter_type std::num_get**< _CharT, _InIter >::do_get (**iter_type** *__beg*, **iter_type** *__end*, **ios_base** & *__io*, **ios_base::iostate** & *__err*, unsigned long & *__v*) const `[inline]`, `[protected]`, `[virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2191 of file locale_facets.h.

4.891.4.6 template<typename _CharT , typename _InIter > virtual **iter_type std::num_get**< _CharT, _InIter >::do_get (**iter_type** *__beg*, **iter_type** *__end*, **ios_base** & *__io*, **ios_base::iostate** & *__err*, long long & *__v*) const `[inline]`, `[protected]`, `[virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2197 of file locale_facets.h.

4.891.4.7 template< typename _CharT , typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long long & __v) const [inline], [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2202 of file locale_facets.h.

4.891.4.8 template< typename _CharT , typename _InIter > _InIter std::num_get< _CharT, _InIter >::do_get (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, float & __v) const [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 686 of file locale_facets.tcc.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::reserve().

4.891.4.9 template<typename _CharT , typename _InIter > _InIter **std::num_get**< _CharT, _InIter >::do_get (**iter_type** *__beg,* **iter_type** *__end,* **ios_base** & *__io,* **ios_base::iostate** & *__err,* double & *__v*) const `[protected]`, `[virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 701 of file locale_facets.tcc.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::reserve().

4.891.4.10 template<typename _CharT , typename _InIter > _InIter **std::num_get**< _CharT, _InIter >::do_get (**iter_type** *__beg,* **iter_type** *__end,* **ios_base** & *__io,* **ios_base::iostate** & *__err,* long double & *__v*) const `[protected]`, `[virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

4.891.4.11 template<typename _CharT , typename _InIter > _InIter std::num_get< _CharT, _InIter >::do_get (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, void *& __v) const [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 748 of file locale_facets.tcc.

References std::ios_base::basefield, std::ios_base::flags(), and std::ios_base::hex.

4.891.4.12 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, bool & __v) const [inline]

Numeric parsing.

Parses the input stream into the bool *v*. It does so by calling num_get::do_get().

If ios_base::boolalpha is set, attempts to read ctype<CharT>::truename() or ctype<CharT>::falsename(). Sets *v* to true or false if successful. Sets err to ios_base::failbit if reading the string fails. Sets err to ios_base::eofbit if the stream is emptied.

If ios_base::boolalpha is not set, proceeds as with reading a long, except if the value is 1, sets *v* to true, if the value is 0, sets *v* to false, and otherwise set err to ios_base::failbit.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 1962 of file locale_facets.h.

Referenced by std::basic_istream< _CharT, _Traits >::operator>>().

4.891.4.13 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* long & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 1999 of file locale_facets.h.

4.891.4.14 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* unsigned short & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2004 of file locale_facets.h.

4.891.4.15 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* unsigned int & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2014 of file locale_facets.h.

4.891.4.17 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* long long & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2020 of file locale_facets.h.

4.891.4.18 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* unsigned long long & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2025 of file locale_facets.h.

4.891.4.19 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, float & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2059 of file locale_facets.h.

4.891.4.20 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, double & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2064 of file locale_facets.h.

4.891.4.21 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* long double & *__v*) const [inline]

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2069 of file locale_facets.h.

4.891.4.22 template<typename _CharT , typename _InIter > iter_type std::num_get< _CharT, _InIter >::get (iter_type *__in,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* void *& *__v*) const [inline]

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf p specifier.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2102 of file locale_facets.h.

4.892.1 Detailed Description

template<typename _CharT, typename _OutIter>class std::num_put< _CharT, _OutIter >

Primary class template num_put.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.

The num_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_put facet.

Definition at line 2254 of file locale_facets.h.

4.892.2 Member Typedef Documentation

4.892.2.1 template<typename _CharT , typename _OutIter > typedef _CharT std::num_put< _CharT, _OutIter >::char_type

Public typedefs.

Definition at line 2260 of file locale_facets.h.

4.892.2.2 template<typename _CharT , typename _OutIter > typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type

Public typedefs.

Definition at line 2261 of file locale_facets.h.

4.892.3 Constructor & Destructor Documentation

4.892.3.1 template<typename _CharT , typename _OutIter > std::num_put< _CharT, _OutIter >::num_put (size_t *__refs* = 0) [inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 2275 of file locale_facets.h.

4.892.3.2 template<typename _CharT , typename _OutIter > virtual std::num_put< _CharT, _OutIter >::~num_put ( ) [inline], [protected], [virtual]

Destructor.

Definition at line 2454 of file locale_facets.h.

4.892.4 Member Function Documentation

4.892.4.1 template<typename _CharT , typename _OutIter > _OutIter **std::num_put**< _CharT, _OutIter >::do_put (**iter_type** *__s,* **ios_base** & *__io,* **char_type** *__fill,* bool *__v*) const `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1089 of file locale_facets.tcc.

References std::ios_base::_M_getloc(), std::ios_base::adjustfield, std::ios_base::boolalpha, std::ios_base::flags(), std::ios_base::left, and std::ios_base::width().

4.892.4.2 template<typename _CharT , typename _OutIter > virtual **iter_type std::num_put**< _CharT, _OutIter >::do_put (**iter_type** *__s,* **ios_base** & *__io,* **char_type** *__fill,* long *__v*) const `[inline]`, `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2474 of file locale_facets.h.

4.892.4.3 template<typename _CharT , typename _OutIter > virtual **iter_type std::num_put**< _CharT, _OutIter >::do_put (**iter_type** *__s,* **ios_base** & *__io,* **char_type** *__fill,* unsigned long *__v*) const `[inline]`, `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2478 of file locale_facets.h.

4.892.4.4 template<typename _CharT , typename _OutIter > virtual iter_type std::num_put< _CharT, _OutIter >::do_put (iter_type *__s,* ios_base & *__io,* char_type *__fill,* long long *__v*) const [inline], [protected], [virtual]

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2484 of file locale_facets.h.

4.892.4.5 template<typename _CharT , typename _OutIter > virtual iter_type std::num_put< _CharT, _OutIter >::do_put (iter_type *__s,* ios_base & *__io,* char_type *__fill,* unsigned long long *__v*) const [inline], [protected], [virtual]

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2489 of file locale_facets.h.

4.892.4.6 template<typename _CharT , typename _OutIter > _OutIter **std::num_put**< _CharT, _OutIter >::do_put (**iter_type** *__s,* **ios_base** & *__io,* **char_type** *__fill,* double *__v*) const [protected], [virtual]

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1141 of file locale_facets.tcc.

4.892.4.7 template<typename _CharT , typename _OutIter > _OutIter **std::num_put**< _CharT, _OutIter >::do_put (**iter_type** *__s,* **ios_base** & *__io,* **char_type** *__fill,* long double *__v*) const [protected], [virtual]

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1155 of file locale_facets.tcc.

4.892.4.8 template<typename _CharT , typename _OutIter > _OutIter **std::num_put**< _CharT, _OutIter >::do_put (**iter_type** *__s,* **ios_base** & *__io,* **char_type** *__fill,* const void * *__v*) const [protected], [virtual]

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1162 of file locale_facets.tcc.

References std::ios_base::flags(), std::ios_base::hex, and std::ios_base::uppercase.

4.892.4.9 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type *__s,* ios_base & *__io,* char_type *__fill,* bool *__v*) const [inline]

Numeric formatting.

Formats the boolean *v* and inserts it into a stream. It does so by calling num_put::do_put().

If ios_base::boolalpha is set, writes ctype<CharT>::truename() or ctype<CharT>::falsename(). Otherwise formats *v* as an int.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2293 of file locale_facets.h.

4.892.4.10 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type *__s,* ios_base & *__io,* char_type *__fill,* long *__v*) const [inline]

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2335 of file locale_facets.h.

4.892.4.11 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type __s, ios_base & __io, char_type __fill, unsigned long __v) const [inline]

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2339 of file locale_facets.h.

4.892.4.12 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type __s, ios_base & __io, char_type __fill, long long __v) const [inline]

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2345 of file locale_facets.h.

4.892.4.13 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type *__s*, ios_base & *__io*, char_type *__fill*, unsigned long long *__v*) const [inline]

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2349 of file locale_facets.h.

4.892.4.14 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type *__s*, ios_base & *__io*, char_type *__fill*, double *__v*) const [inline]

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::floatfield. If equal to ios_base::fixed, formats like the printf f specifier. Else if equal to ios_base::scientific, formats like e or E with ios_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.

The output precision is given by io.precision(). This precision is capped at numeric_limits::digits10 + 2 (different for double and long double). The default precision is 6.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showpoint is set, a decimal point will always be output.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2398 of file locale_facets.h.

4.892.4.15 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type *__s*, ios_base & *__io*, char_type *__fill*, long double *__v*) const [inline]

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::floatfield. If equal to ios_base::fixed, formats like the printf f specifier. Else if equal to ios_base::scientific, formats like e or E with ios_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.

The output precision is given by io.precision(). This precision is capped at numeric_limits::digits10 + 2 (different for double and long double). The default precision is 6.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showpoint is set, a decimal point will always be output.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2402 of file locale_facets.h.

4.892.4.16 template<typename _CharT , typename _OutIter > iter_type std::num_put< _CharT, _OutIter >::put (iter_type *__s,* ios_base & *__io,* char_type *__fill,* const void * *__v*) const [inline]

Numeric formatting.

Formats the pointer value *v* and inserts it into a stream. It does so by calling num_put::do_put().

This function formats *v* as an unsigned long with ios_base::hex and ios_base::showbase set.

Parameters

__s	Stream to write to.
__io	Source of locale and flags.
__fill	Char_type to use for filling.
__v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2423 of file locale_facets.h.

4.893.1 Detailed Description

template<typename _Tp>struct std::numeric_limits< _Tp >

Properties of fundamental types.

This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

_GLIBCXX_RESOLVE_LIB_DEFECTS: DRs 201 and 184 (hi Gaby!) are noted, but not incorporated in this documented (yet).

Definition at line 304 of file limits.

4.893.2 Member Function Documentation

4.893.2.1 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::denorm_min ( ) `[inline]`, `[static]`, `[noexcept]`

The minimum positive denormalized value. For types where `has_denorm` is false, this is the minimum positive normalized value.

Definition at line 349 of file limits.

4.893.2.2 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::epsilon ( ) `[inline]`, `[static]`, `[noexcept]`

The *machine epsilon:* the difference between 1 and the least value greater than 1 that is representable.

Definition at line 325 of file limits.

Referenced by std::binomial_distribution< _IntType >::operator()(), and std::poisson_distribution< _IntType >::operator()().

4.893.2.3 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::infinity ( ) `[inline]`, `[static]`, `[noexcept]`

The representation of positive infinity, if `has_infinity`.

Definition at line 333 of file limits.

4.893.2.4 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::lowest ( ) `[inline]`, `[static]`, `[noexcept]`

A finite value x such that there is no other finite value y where y < x.

Definition at line 319 of file limits.

4.893.2.5 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::max ( ) [inline], [static], [noexcept]

The maximum finite value.

Definition at line 313 of file limits.

Referenced by std::normal_distribution< result_type >::max(), std::lognormal_distribution< _RealType >::max(), std::gamma_distribution< result_type >::max(), std::chi_squared_distribution< _RealType >::max(), std::cauchy_distribution< _RealType >::max(), std::fisher_f_distribution< _RealType >::max(), std::student_t_distribution< _RealType >::max(), std::bernoulli_distribution::max(), std::geometric_distribution< _IntType >::max(), std::negative_binomial_distribution< _IntType >::max(), std::poisson_distribution< _IntType >::max(), std::exponential_distribution< _RealType >::max(), std::weibull_distribution< _RealType >::max(), std::extreme_value_distribution< _RealType >::max(), std::tr2::dynamic_bitset< _WordT, _Alloc >::max_size(), std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()(), std::binomial_distribution< _IntType >::operator()(), and std::poisson_distribution< _IntType >::operator()().

4.893.2.6 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::min ( ) [inline], [static], [noexcept]

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Definition at line 309 of file limits.

Referenced by std::normal_distribution< result_type >::min(), std::cauchy_distribution< _RealType >::min(), std::student_t_distribution< _RealType >::min(), std::bernoulli_distribution::min(), std::extreme_value_distribution< _RealType >::min(), and std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()().

4.893.2.7 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::quiet_NaN ( ) [inline], [static], [noexcept]

The representation of a quiet Not a Number, if `has_quiet_NaN`.

Definition at line 338 of file limits.

4.893.2.8 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::round_error ( ) [inline], [static], [noexcept]

The maximum rounding error measurement (see LIA-1).

Definition at line 329 of file limits.

4.893.2.9 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::signaling_NaN ( ) [inline], [static], [noexcept]

The representation of a signaling Not a Number, if `has_signaling_NaN`.

Definition at line 343 of file limits.

4.893.3 Member Data Documentation

4.893.3.1 constexpr int std::__numeric_limits_base::digits [static], [inherited]

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Definition at line 200 of file limits.

4.893.3.2 constexpr int std::__numeric_limits_base::digits10 `[static]`, `[inherited]`

The number of base 10 digits that can be represented without change.

Definition at line 203 of file limits.

4.893.3.3 constexpr float_denorm_style std::__numeric_limits_base::has_denorm `[static]`, `[inherited]`

See std::float_denorm_style for more information.

Definition at line 255 of file limits.

4.893.3.4 constexpr bool std::__numeric_limits_base::has_denorm_loss `[static]`, `[inherited]`

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

Definition at line 259 of file limits.

4.893.3.5 constexpr bool std::__numeric_limits_base::has_infinity `[static]`, `[inherited]`

True if the type has a representation for positive infinity.

Definition at line 244 of file limits.

4.893.3.6 constexpr bool std::__numeric_limits_base::has_quiet_NaN `[static]`, `[inherited]`

True if the type has a representation for a quiet (non-signaling) Not a Number.

Definition at line 248 of file limits.

4.893.3.7 constexpr bool std::__numeric_limits_base::has_signaling_NaN `[static]`, `[inherited]`

True if the type has a representation for a signaling Not a Number.

Definition at line 252 of file limits.

4.893.3.8 constexpr bool std::__numeric_limits_base::is_bounded `[static]`, `[inherited]`

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

Definition at line 268 of file limits.

4.893.3.9 constexpr bool std::__numeric_limits_base::is_exact `[static]`, `[inherited]`

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

Definition at line 220 of file limits.

4.893.3.10 constexpr bool std::__numeric_limits_base::is_iec559 `[static]`, `[inherited]`

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

Definition at line 263 of file limits.

4.893.3.11 constexpr bool std::__numeric_limits_base::is_integer `[static]`, `[inherited]`

True if the type is integer.

Definition at line 215 of file limits.

4.893.3.12 constexpr bool std::__numeric_limits_base::is_modulo `[static]`, `[inherited]`

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or ∗ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

Definition at line 277 of file limits.

4.893.3.13 constexpr bool std::__numeric_limits_base::is_signed `[static]`, `[inherited]`

True if the type is signed.

Definition at line 212 of file limits.

4.893.3.14 constexpr bool std::__numeric_limits_base::is_specialized `[static]`, `[inherited]`

This will be true for all fundamental types (which have specializations), and false for everything else.

Definition at line 195 of file limits.

4.893.3.15 constexpr int std::__numeric_limits_base::max_digits10 `[static]`, `[inherited]`

The number of base 10 digits required to ensure that values which differ are always differentiated.

Definition at line 208 of file limits.

4.893.3.16 constexpr int std::__numeric_limits_base::max_exponent `[static]`, `[inherited]`

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

Definition at line 237 of file limits.

4.893.3.17 constexpr int std::__numeric_limits_base::max_exponent10 `[static]`, `[inherited]`

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

Definition at line 241 of file limits.

4.893.3.18 constexpr int std::__numeric_limits_base::min_exponent `[static]`, `[inherited]`

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

Definition at line 228 of file limits.

4.893.3.19 constexpr int std::__numeric_limits_base::min_exponent10 `[static]`, `[inherited]`

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

Definition at line 232 of file limits.

4.893.3.20 constexpr int std::__numeric_limits_base::radix `[static]`, `[inherited]`

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Definition at line 224 of file limits.

4.893.3.21 constexpr float_round_style std::__numeric_limits_base::round_style `[static]`, `[inherited]`

See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

Definition at line 288 of file limits.

4.893.3.22 constexpr bool std::__numeric_limits_base::tinyness_before `[static]`, `[inherited]`

True if tininess is detected before rounding. (see IEC 559)

Definition at line 283 of file limits.

4.893.3.23 constexpr bool std::__numeric_limits_base::traps `[static]`, `[inherited]`

True if trapping is implemented for this type.

Definition at line 280 of file limits.

4.912.1 Detailed Description

template<typename _CharT>class std::numpunct< _CharT >

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

Definition at line 1641 of file locale_facets.h.

4.912.2 Member Typedef Documentation

4.912.2.1 template<typename _CharT > typedef _CharT std::numpunct< _CharT >::char_type

Public typedefs.

Definition at line 1647 of file locale_facets.h.

4.912.2.2 template<typename _CharT > typedef basic_string<_CharT> std::numpunct< _CharT >::string_type

Public typedefs.

4.912.3 Constructor & Destructor Documentation

4.912.3.1 template<typename _CharT > std::numpunct< _CharT >::numpunct (size_t __refs = 0) [inline], [explicit]

Numpunct constructor.

Parameters

__refs	Refcount to pass to the base class.

Definition at line 1665 of file locale_facets.h.

4.912.3.2 template<typename _CharT > std::numpunct< _CharT >::numpunct (__cache_type * __cache, size_t __refs = 0) [inline], [explicit]

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

Parameters

__cache	__numpunct_cache object.
__refs	Refcount to pass to the base class.

Definition at line 1679 of file locale_facets.h.

4.912.3.3 template<typename _CharT > std::numpunct< _CharT >::numpunct (__c_locale __cloc, size_t __refs = 0) [inline], [explicit]

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__refs	Refcount to pass to the base class.

Definition at line 1693 of file locale_facets.h.

4.912.3.4 template<typename _CharT > virtual std::numpunct< _CharT >::~numpunct ( ) [protected], [virtual]

Destructor.

4.912.4 Member Function Documentation

4.912.4.1 template<typename _CharT > char_type std::numpunct< _CharT >::decimal_point ( ) const [inline]

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning numpunct<char_type>::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1707 of file locale_facets.h.

4.912.4.2 template<typename _CharT > virtual char_type std::numpunct< _CharT >::do_decimal_point ( ) const `[inline]`, `[protected]`, `[virtual]`

Return decimal point character.

Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1794 of file locale_facets.h.

4.912.4.3 template<typename _CharT > virtual string_type std::numpunct< _CharT >::do_falsename ( ) const `[inline]`, `[protected]`, `[virtual]`

Return string representation of bool false.

Returns a string_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Definition at line 1845 of file locale_facets.h.

4.912.4.4 template<typename _CharT > virtual string std::numpunct< _CharT >::do_grouping ( ) const `[inline]`, `[protected]`, `[virtual]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See Also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1819 of file locale_facets.h.

4.912.4.5 template<typename _CharT > virtual char_type std::numpunct< _CharT >::do_thousands_sep ( ) const `[inline]`, `[protected]`, `[virtual]`

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1806 of file locale_facets.h.

4.912.4.6 template<typename _CharT > virtual string_type std::numpunct< _CharT >::do_truename ( ) const [inline], [protected], [virtual]

Return string representation of bool true.

Returns a string_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Definition at line 1832 of file locale_facets.h.

4.912.4.7 template<typename _CharT > string_type std::numpunct< _CharT >::falsename ( ) const [inline]

Return string representation of bool false.

This function returns a string_type containing the text representation for false bool variables. It does so by calling numpunct<char_type>::do_falsename().

Returns

string_type representing printed form of false.

Definition at line 1777 of file locale_facets.h.

4.912.4.8 template<typename _CharT > string std::numpunct< _CharT >::grouping ( ) const [inline]

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling numpunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1751 of file locale_facets.h.

4.912.4.9 template<typename _CharT > char_type std::numpunct< _CharT >::thousands_sep ( ) const [inline]

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning numpunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1720 of file locale_facets.h.

4.912.4.10 template<typename _CharT > string_type std::numpunct< _CharT >::truename ( ) const [inline]

Return string representation of bool true.

This function returns a string_type containing the text representation for true bool variables. It does so by calling numpunct<char_type>::do_truename().

Returns

string_type representing printed form of true.

Definition at line 1764 of file locale_facets.h.

4.912.5 Member Data Documentation

4.912.5.1 template<typename _CharT > locale::id std::numpunct< _CharT >::id [static]

- ostream_iterator & operator= (const _Tp &__value)

4.915.1 Detailed Description

template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>class std::ostream_iterator< _Tp, _CharT, _Traits >

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type Tp is the only type written by this iterator and there must be an operator<<(Tp) defined.

Template Parameters

_Tp	The type to write to the ostream.
_CharT	The ostream char_type.
_Traits	The ostream char_traits.

Definition at line 154 of file stream_iterator.h.

4.915.2 Member Typedef Documentation

4.915.2.1 template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _CharT std::ostream_iterator< _Tp, _CharT, _Traits >::char_type

Public typedef.

Definition at line 160 of file stream_iterator.h.

4.915.2.2 typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.915.2.3 typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category [inherited]

One of the tag types.

Definition at line 121 of file stl_iterator_base_types.h.

4.915.2.4 template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef **basic_ostream**<_CharT, _Traits> **std::ostream_iterator**< _Tp, _CharT, _Traits >**::ostream_type**

Public typedef.

Definition at line 162 of file stream_iterator.h.

4.915.2.5 typedef void **std::iterator**< **output_iterator_tag** , void , void , void , void >**::pointer** `[inherited]`

This type represents a pointer-to-value_type.

Definition at line 127 of file stl_iterator_base_types.h.

4.915.2.6 typedef void **std::iterator**< **output_iterator_tag** , void , void , void , void >**::reference** `[inherited]`

This type represents a reference-to-value_type.

Definition at line 129 of file stl_iterator_base_types.h.

4.915.2.7 template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _Traits **std::ostream_iterator**< _Tp, _CharT, _Traits >**::traits_type**

Public typedef.

Definition at line 161 of file stream_iterator.h.

4.915.2.8 typedef void **std::iterator**< **output_iterator_tag** , void , void , void , void >**::value_type** `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file stl_iterator_base_types.h.

4.915.3 Constructor & Destructor Documentation

4.915.3.1 template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> **std::ostream_iterator**< _Tp, _CharT, _Traits >**::ostream_iterator** (**ostream_type** & *__s*) `[inline]`

Construct from an ostream.

Definition at line 171 of file stream_iterator.h.

4.915.3.2 template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> **std::ostream_iterator**< _Tp, _CharT, _Traits >**::ostream_iterator** (**ostream_type** & *__s*, const _CharT * *__c*) `[inline]`

Construct from an ostream.

The delimiter string *c* is written to the stream after every Tp written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

Parameters

__s	Underlying ostream to write to.
__c	CharT delimiter string to insert.

Definition at line 183 of file stream_iterator.h.

4.915.3.3 template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> **std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator** (const ostream_iterator< _Tp, _CharT, _Traits > & *__obj*) [inline]

Copy constructor.

Definition at line 187 of file stream_iterator.h.

4.915.4 Member Function Documentation

4.915.4.1 template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> **ostream_iterator& std::ostream_iterator< _Tp, _CharT, _Traits >::operator=** (const _Tp & *__value*) [inline]

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream.

Definition at line 193 of file stream_iterator.h.

The documentation for this class was generated from the following file:

- stream_iterator.h

4.916.1 Detailed Description

template<typename _CharT, typename _Traits>class std::ostreambuf_iterator< _CharT, _Traits >

Provides output iterator semantics for streambufs.

Definition at line 216 of file streambuf_iterator.h.

4.916.2 Member Typedef Documentation

4.916.2.1 template<typename _CharT , typename _Traits > typedef _CharT std::ostreambuf_iterator< _CharT, _Traits >::char_type

Public typedefs.

Definition at line 223 of file streambuf_iterator.h.

4.916.2.2 typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.916.2.3 typedef **output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category** [inherited]

One of the tag types.

Definition at line 121 of file stl_iterator_base_types.h.

4.916.2.4 template<typename _CharT , typename _Traits > typedef **basic_ostream**<_CharT, _Traits> **std::ostreambuf_iterator**< _CharT, _Traits >**::ostream_type**

Public typedefs.

Definition at line 226 of file streambuf_iterator.h.

4.916.2.5 typedef void **std::iterator< output_iterator_tag** , void , void , void , void >**::pointer** [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file stl_iterator_base_types.h.

4.916.2.6 typedef void **std::iterator< output_iterator_tag** , void , void , void , void >**::reference** [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file stl_iterator_base_types.h.

4.916.2.7 template<typename _CharT , typename _Traits > typedef **basic_streambuf**<_CharT, _Traits> **std::ostreambuf_iterator**< _CharT, _Traits >**::streambuf_type**

Public typedefs.

Definition at line 225 of file streambuf_iterator.h.

4.916.2.8 template<typename _CharT , typename _Traits > typedef _Traits **std::ostreambuf_iterator**< _CharT, _Traits >**::traits_type**

Public typedefs.

Definition at line 224 of file streambuf_iterator.h.

4.916.2.9 typedef void **std::iterator< output_iterator_tag** , void , void , void , void >**::value_type** [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file stl_iterator_base_types.h.

4.916.3 Constructor & Destructor Documentation

4.916.3.1 template<typename _CharT , typename _Traits > **std::ostreambuf_iterator**< _CharT, _Traits >**::ostreambuf_iterator** (**ostream_type** & *__s*) [inline], [noexcept]

Construct output iterator from ostream.

Definition at line 241 of file streambuf_iterator.h.

4.916.3.2 template<typename _CharT , typename _Traits > **std::ostreambuf_iterator**< _CharT, _Traits >**::ostreambuf_iterator** (**streambuf_type** ∗ *__s*) [inline], [noexcept]

Construct output iterator from streambuf.

Definition at line 245 of file streambuf_iterator.h.

4.916.4 Member Function Documentation

4.916.4.1 template<typename _CharT , typename _Traits > bool std::ostreambuf_iterator< _CharT, _Traits >::failed ( ) const [inline], [noexcept]

Return true if previous operator=() failed.

Definition at line 275 of file streambuf_iterator.h.

4.916.4.2 template<typename _CharT , typename _Traits > ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator* ( ) [inline]

Return *this.

Definition at line 260 of file streambuf_iterator.h.

4.916.4.3 template<typename _CharT , typename _Traits > ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++ (int) [inline]

Return *this.

Definition at line 265 of file streambuf_iterator.h.

4.916.4.4 template<typename _CharT , typename _Traits > ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++ ( ) [inline]

Return *this.

Definition at line 270 of file streambuf_iterator.h.

4.916.4.5 template<typename _CharT , typename _Traits > ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator= (_CharT *__c*) [inline]

Write character to streambuf. Calls streambuf.sputc().

Definition at line 250 of file streambuf_iterator.h.

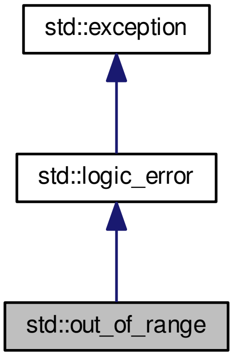
References std::basic_streambuf< _CharT, _Traits >::sputc().

The documentation for this class was generated from the following file:

- streambuf_iterator.h

4.917 std::out_of_range Class Reference

Inheritance diagram for std::out_of_range:



Public Member Functions

- **out_of_range** (const string &__arg)
- virtual const char ∗ what () const noexcept

4.917.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in basic_string).

Definition at line 100 of file stdexcept.

4.917.2 Member Function Documentation

4.917.2.1 virtual const char∗ std::logic_error::what ( ) const `[virtual]`, `[noexcept]`, `[inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.

Reimplemented in std::future_error.

The documentation for this class was generated from the following file:

- stdexcept

4.918 std::output_iterator_tag Struct Reference

4.918.1 Detailed Description

Marking output iterators.

Definition at line 92 of file stl_iterator_base_types.h.

The documentation for this struct was generated from the following file:

4.922.1 Detailed Description

template<class _T1, class _T2>struct std::pair< _T1, _T2 >

Struct holding two objects of arbitrary type.

Template Parameters

_T1	Type of first object.
_T2	Type of second object.

Definition at line 96 of file stl_pair.h.

4.922.2 Member Typedef Documentation

4.922.2.1 template<class _T1, class _T2> typedef _T2 **std::pair< _T1, _T2 >::second_type**

`first_type` is the first bound type

Definition at line 99 of file stl_pair.h.

4.922.3 Constructor & Destructor Documentation

4.922.3.1 template<class _T1, class _T2> constexpr **std::pair< _T1, _T2 >::pair ( )** `[inline]`

`second` is a copy of the second object

The default constructor creates `first` and `second` using their respective default constructors.

Definition at line 108 of file stl_pair.h.

4.922.3.2 template<class _T1, class _T2> constexpr **std::pair< _T1, _T2 >::pair (const _T1 & *__a*, const _T2 & *__b*)** `[inline]`

Two objects may be passed to a `pair` constructor to be copied.

Definition at line 112 of file stl_pair.h.

4.922.3.3 template<class _T1, class _T2> template<class _U1 , class _U2 , class = typename enable_if<__and_<is_convertible<const _U1&, _T1>, is_convertible<const _U2&, _T2>>::value>::type> constexpr **std::pair< _T1, _T2 >::pair (const pair< _U1, _U2 > & *__p*)** `[inline]`

There is also a templated copy ctor for the `pair` class itself.

Definition at line 124 of file stl_pair.h.

4.922.4 Member Data Documentation

4.922.4.1 template<class _T1, class _T2> _T1 **std::pair**< _T1, _T2 >::first

`second_type` is the second bound type

Definition at line 101 of file stl_pair.h.

Referenced by std::_Temporary_buffer< _ForwardIterator, _Tp >::_Temporary_buffer(), std::set< _StateIdT >::insert(), std::operator<(), and std::operator==().

4.922.4.2 template<class _T1, class _T2> _T2 **std::pair**< _T1, _T2 >::second

`first` is a copy of the first object

Definition at line 102 of file stl_pair.h.

Referenced by std::_Temporary_buffer< _ForwardIterator, _Tp >::_Temporary_buffer(), std::set< _StateIdT >::insert(), and std::operator==().

The documentation for this struct was generated from the following files:

4.923.1 Detailed Description

template<typename _RealType = double>class std::piecewise_constant_distribution< _RealType >

A piecewise_constant_distribution random number distribution.

The formula for the piecewise constant probability mass function is

Definition at line 5480 of file random.h.

4.923.2 Member Typedef Documentation

4.923.2.1 template<typename _RealType = double> typedef _RealType std::piecewise_constant_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 5483 of file random.h.

4.923.3 Member Function Documentation

4.923.3.1 template<typename _RealType = double> std::vector<double> std::piecewise_constant_distribution< _RealType >::densities ( ) const [inline]

Returns a vector of the probability densities.

Definition at line 5601 of file random.h.

References std::vector< _Tp, _Alloc >::empty().

4.923.3.2 template<typename _RealType = double> std::vector<_RealType> std::piecewise_constant_distribution< _RealType >::intervals ( ) const [inline]

Returns a vector of the intervals.

Definition at line 5585 of file random.h.

References std::vector< _Tp, _Alloc >::empty().

4.923.3.3 template<typename _RealType = double> result_type std::piecewise_constant_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 5636 of file random.h.

References std::vector< _Tp, _Alloc >::back(), and std::vector< _Tp, _Alloc >::empty().

4.923.3.4 template<typename _RealType = double> result_type std::piecewise_constant_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 5626 of file random.h.

References std::vector< _Tp, _Alloc >::empty(), and std::vector< _Tp, _Alloc >::front().

4.923.3.5 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::piecewise_constant_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & __*urng*) [inline]

Generating functions.

Definition at line 5647 of file random.h.

References std::piecewise_constant_distribution< _RealType >::operator()().

Referenced by std::piecewise_constant_distribution< _RealType >::operator()().

4.923.3.6 template<typename _RealType = double> param_type std::piecewise_constant_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 5611 of file random.h.

4.923.3.7 template<typename _RealType = double> void std::piecewise_constant_distribution< _RealType >::param (const param_type & __*param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 5619 of file random.h.

4.923.3.8 template<typename _RealType = double> void std::piecewise_constant_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 5578 of file random.h.

4.923.4 Friends And Related Function Documentation

4.923.4.1 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > **std::basic_ostream**<_CharT, _Traits>& operator<< (**std::basic_ostream**< _CharT, _Traits > & *__os*, const **std::piecewise_constant_distribution**< _RealType1 > & *__x*) `[friend]`

Inserts a piecewise_constan_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A piecewise_constan_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.923.4.2 template<typename _RealType = double> bool operator== (const **piecewise_constant_distribution**< _RealType > & *__d1*, const **piecewise_constant_distribution**< _RealType > & *__d2*) `[friend]`

Return true if two piecewise constant distributions have the same parameters.

Definition at line 5682 of file random.h.

4.923.4.3 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > **std::basic_istream**<_CharT, _Traits>& operator>> (**std::basic_istream**< _CharT, _Traits > & *__is*, **std::piecewise_constant_distribution**< _RealType1 > & *__x*) `[friend]`

Extracts a piecewise_constan_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A piecewise_constan_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.926.1 Detailed Description

template<typename _RealType = double>class std::piecewise_linear_distribution< _RealType >

A piecewise_linear_distribution random number distribution.

The formula for the piecewise linear probability mass function is

Definition at line 5747 of file random.h.

4.926.2 Member Typedef Documentation

4.926.2.1 template<typename _RealType = double> typedef _RealType std::piecewise_linear_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 5750 of file random.h.

4.926.3 Member Function Documentation

4.926.3.1 template<typename _RealType = double> std::vector<double> std::piecewise_linear_distribution< _RealType >::densities ( ) const [inline]

Return a vector of the probability densities of the distribution.

Definition at line 5871 of file random.h.

References std::vector< _Tp, _Alloc >::empty().

4.926.3.2 template<typename _RealType = double> std::vector<_RealType> std::piecewise_linear_distribution< _RealType >::intervals ( ) const [inline]

Return the intervals of the distribution.

Definition at line 5854 of file random.h.

References std::vector< _Tp, _Alloc >::empty().

4.926.3.3 template<typename _RealType = double> result_type std::piecewise_linear_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 5906 of file random.h.

References std::vector< _Tp, _Alloc >::back(), and std::vector< _Tp, _Alloc >::empty().

4.926.3.4 template<typename _RealType = double> result_type std::piecewise_linear_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 5896 of file random.h.

References std::vector< _Tp, _Alloc >::empty(), and std::vector< _Tp, _Alloc >::front().

4.926.3.5 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::piecewise_linear_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

Definition at line 5917 of file random.h.

References std::piecewise_linear_distribution< _RealType >::operator()().

Referenced by std::piecewise_linear_distribution< _RealType >::operator()().

4.926.3.6 template<typename _RealType = double> param_type std::piecewise_linear_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 5881 of file random.h.

4.926.3.7 template<typename _RealType = double> void std::piecewise_linear_distribution< _RealType >::param (const param_type & __param) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 5889 of file random.h.

4.926.3.8 template<typename _RealType = double> void std::piecewise_linear_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 5847 of file random.h.

4.926.4 Friends And Related Function Documentation

4.926.4.1 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::piecewise_linear_distribution< _RealType1 > & __x) [friend]

Inserts a piecewise_linear_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A piecewise_linear_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.926.4.2 template<typename _RealType = double> bool operator== (const piecewise_linear_distribution< _RealType > & __d1, const piecewise_linear_distribution< _RealType > & __d2) [friend]

Return true if two piecewise linear distributions have the same parameters.

Definition at line 5952 of file random.h.

4.926.4.3 template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & __is, std::piecewise_linear_distribution< _RealType1 > & __x) [friend]

Extracts a piecewise_linear_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A piecewise_linear_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

A rejection algorithm when mean >= 12 and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if _GLIBCXX_USE_C99_MATH_TR1 is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).

Definition at line 1436 of file bits/random.tcc.

References std::abs(), std::numeric_limits< _Tp >::epsilon(), std::log(), and std::numeric_limits< _Tp >::max().

4.933.3.6 template<typename _IntType = int> **param_type std::poisson_distribution**< _IntType >::param ( ) const `[inline]`

Returns the parameter set of the distribution.

Definition at line 4501 of file random.h.

4.933.3.7 template<typename _IntType = int> void **std::poisson_distribution**< _IntType >::param (const **param_type** & *__param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 4509 of file random.h.

4.933.3.8 template<typename _IntType = int> void **std::poisson_distribution**< _IntType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 4487 of file random.h.

References std::normal_distribution< _RealType >::reset().

4.933.4 Friends And Related Function Documentation

4.933.4.1 template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > **std::basic_ostream**<_CharT, _Traits>& operator<< (**std::basic_ostream**< _CharT, _Traits > & *__os*, const **std::poisson_distribution**< _IntType1 > & *__x*) [friend]

Inserts a poisson_distribution random number distribution `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A poisson_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.933.4.2 template<typename _IntType = int> bool operator== (const **poisson_distribution**< _IntType > & *__d1*, const **poisson_distribution**< _IntType > & *__d2*) [friend]

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4567 of file random.h.

4.933.4.3 template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > **std::basic_istream**<_CharT, _Traits>& operator>> (**std::basic_istream**< _CharT, _Traits > & *__is*, **std::poisson_distribution**< _IntType1 > & *__x*) [friend]

Extracts a poisson_distribution random number distribution `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A poisson_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

- _Compare **comp**

4.935.1 Detailed Description

template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>class std::priority_queue< _Tp, _Sequence, _Compare >

A standard container automatically sorting its contents.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to vector<_Tp>.
_Compare	Comparison function object type, defaults to less<_Sequence::value_type>.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to std::vector, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as std::deque or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

Note

No equality/comparison operators are provided for priority_queue.
Sorting of the elements takes place as they are added to, and removed from, the priority_queue using the priority_queue's member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the priority_queue will not re-sort the elements for you. (How could it know to do so?)

Definition at line 367 of file stl_queue.h.

4.935.2 Constructor & Destructor Documentation

4.935.2.1 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (const _Compare & *__x*, const _Sequence & *__s*) [inline], [explicit]

Default constructor creates no elements.

Definition at line 402 of file stl_queue.h.

References std::make_heap().

4.935.2.2 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> template<typename _InputIterator > std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (_InputIterator *__first*, _InputIterator *__last*, const _Compare & *__x*, const _Sequence & *__s*) [inline]

Builds a queue from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__x	A comparison functor describing a strict weak ordering.
__s	An initial sequence with which to start.

Begins by copying *__s*, inserting a copy of the elements from [first,last) into the copy of *__s*, then ordering the copy according to *__x*.

For more information on function objects, see the documentation on functor base classes.

Definition at line 442 of file stl_queue.h.

References std::make_heap().

4.935.3 Member Function Documentation

4.935.3.1 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> bool std::priority_queue< _Tp, _Sequence, _Compare >::empty ( ) const [inline]

Returns true if the queue is empty.

Definition at line 468 of file stl_queue.h.

Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

4.935.3.2 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> void **std::priority_queue**< _Tp, _Sequence, _Compare >::pop ( ) `[inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 531 of file stl_queue.h.

References std::pop_heap().

Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

4.935.3.3 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> void **std::priority_queue**< _Tp, _Sequence, _Compare >::push (const value_type & *__x*) `[inline]`

Add data to the queue.

Parameters

__x	Data to be added.

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.

Definition at line 496 of file stl_queue.h.

References std::push_heap().

Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

4.935.3.4 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> size_type **std::priority_queue**< _Tp, _Sequence, _Compare >::size ( ) const `[inline]`

Returns the number of elements in the queue.

Definition at line 473 of file stl_queue.h.

4.935.3.5 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> const_reference **std::priority_queue**< _Tp, _Sequence, _Compare >::top ( ) const `[inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 481 of file stl_queue.h.

Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

4.936.1 Detailed Description

template<typename _Tp, typename _Sequence = deque<_Tp>>class std::queue< _Tp, _Sequence >

A standard container giving FIFO behavior.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to deque<_Tp>.

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to std::deque, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as std::list or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.

Definition at line 93 of file stl_queue.h.

4.936.2 Constructor & Destructor Documentation

4.936.2.1 template<typename _Tp, typename _Sequence = deque<_Tp>> **std::queue**< _Tp, _Sequence >::**queue** (const _Sequence & *__c*) [inline], [explicit]

Default constructor creates no elements.

Definition at line 138 of file stl_queue.h.

4.936.3 Member Function Documentation

4.936.3.1 template<typename _Tp, typename _Sequence = deque<_Tp>> reference **std::queue**< _Tp, _Sequence >::back ( ) [inline]

Returns a read/write reference to the data at the last element of the queue.

Definition at line 185 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.3.2 template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference **std::queue**< _Tp, _Sequence >::back ( ) const [inline]

Returns a read-only (constant) reference to the data at the last element of the queue.

Definition at line 196 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.3.3 template<typename _Tp, typename _Sequence = deque<_Tp>> bool **std::queue**< _Tp, _Sequence >::empty ( ) const [inline]

Returns true if the queue is empty.

Definition at line 150 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.3.4 template<typename _Tp, typename _Sequence = deque<_Tp>> reference **std::queue**< _Tp, _Sequence >::front ( ) [inline]

Returns a read/write reference to the data at the first element of the queue.

Definition at line 163 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.3.5 template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::queue< _Tp, _Sequence >::front ( ) const [inline]

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 174 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.3.6 template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue< _Tp, _Sequence >::pop ( ) [inline]

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 238 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.3.7 template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue< _Tp, _Sequence >::push (const value_type & __x) [inline]

Add data to the end of the queue.

Parameters

__x	Data to be added.

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 212 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.3.8 template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::queue< _Tp, _Sequence >::size ( ) const [inline]

Returns the number of elements in the queue.

Definition at line 155 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.936.4 Member Data Documentation

4.936.4.1 template<typename _Tp, typename _Sequence = deque<_Tp>> _Sequence std::queue< _Tp, _Sequence >::c [protected]

'c' is the underlying container. Maintainers wondering why this isn't uglified as per style guidelines should note that this name is specified in the standard, [23.2.3.1]. (Why? Presumably for the same reason that it's protected instead of private: to allow derivation. But none of the other containers allow for derivation. Odd.)

Definition at line 126 of file stl_queue.h.

Referenced by std::queue< _Tp, _Sequence >::back(), std::queue< _Tp, _Sequence >::empty(), std::queue< _Tp, _Sequence >::front(), std::operator<(), std::operator==(), std::queue< _Tp, _Sequence >::pop(), std::queue< _Tp, _Sequence >::push(), and std::queue< _Tp, _Sequence >::size().

- static constexpr intmax_t **num**

4.941.1 Detailed Description

template<intmax_t _Num, intmax_t _Den = 1>struct std::ratio< _Num, _Den >

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type intmax_t. The ratio is simplified when instantiated.

For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

Definition at line 263 of file ratio.

- raw_storage_iterator < _OutputIterator, _Tp > **operator++** (int)
- raw_storage_iterator & **operator=** (const _Tp &__element)

Protected Attributes

- _OutputIterator **_M_iter**

4.944.1 Detailed Description

template< class _OutputIterator, class _Tp > class std::raw_storage_iterator< _OutputIterator, _Tp >

This iterator class lets algorithms store their results into uninitialized memory.

Definition at line 68 of file stl_raw_storage_iter.h.

4.944.2 Member Typedef Documentation

4.944.2.1 typedef void **std::iterator< output_iterator_tag , void , void , void , void >::difference_type** `[inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.944.2.2 typedef **output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category** `[inherited]`

One of the tag types.

Definition at line 121 of file stl_iterator_base_types.h.

4.944.2.3 typedef void **std::iterator< output_iterator_tag , void , void , void , void >::pointer** `[inherited]`

This type represents a pointer-to-value_type.

Definition at line 127 of file stl_iterator_base_types.h.

4.944.2.4 typedef void **std::iterator< output_iterator_tag , void , void , void , void >::reference** `[inherited]`

This type represents a reference-to-value_type.

Definition at line 129 of file stl_iterator_base_types.h.

4.944.2.5 typedef void **std::iterator< output_iterator_tag , void , void , void , void >::value_type** `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file stl_iterator_base_types.h.

The documentation for this class was generated from the following file:

- stl_raw_storage_iter.h

4.945 std::recursive_mutex Class Reference

Inherits std::__recursive_mutex_base.

  result_of< _Tp &(_Args &&...)>
  ::type **operator()** (_Args &&... __args) const
- reference_wrapper & **operator=** (const reference_wrapper< _Tp > &__inref) noexcept

4.946.1 Detailed Description

template<typename _Tp>class std::reference_wrapper< _Tp >

Primary class template for reference_wrapper.

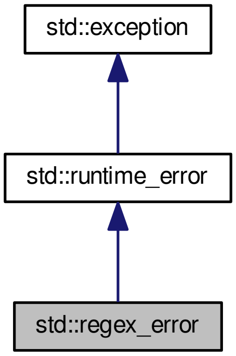
Definition at line 431 of file functional.

The documentation for this class was generated from the following file:

- functional

4.947 std::regex_error Class Reference

Inheritance diagram for std::regex_error:



Public Member Functions

- regex_error (regex_constants::error_type __ecode)
- regex_constants::error_type code () const
- virtual const char ∗ what () const noexcept

4.947.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

Definition at line 136 of file regex_error.h.

4.947.2 Constructor & Destructor Documentation

4.947.2.1 std::regex_error::regex_error (**regex_constants::error_type** *__ecode*) `[explicit]`

Constructs a regex_error object.

Parameters

__ecode	the regex error code.

4.947.3 Member Function Documentation

4.947.3.1 **regex_constants::error_type** std::regex_error::code ( ) const `[inline]`

Gets the regex error code.

Returns

the regex error code.

Definition at line 157 of file regex_error.h.

4.947.3.2 virtual const char∗ std::runtime_error::what ( ) const `[virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.

The documentation for this class was generated from the following file:

- regex_error.h

4.948 std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > Class Template Reference

Public Types

4.948.1 Detailed Description

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >

An iterator adaptor that will provide repeated calls of regex_search over a range until no more matches remain.

Definition at line 2204 of file regex.h.

4.948.2 Constructor & Destructor Documentation

4.948.2.1 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( )

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Todo Implement this function.

Needs documentation! See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html`

4.948.2.2 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (_Bi_iter *__a*, _Bi_iter *__b*, const regex_type & *__re*, regex_constants::match_flag_type *__m = regex_constants::match_default*)

Constructs a regex_iterator...

Parameters

__a	[IN] The start of a text range to search.
__b	[IN] One-past-the-end of the text range to search.
__re	[IN] The regular expression to match.
__m	[IN] Policy flags for match rules.

Todo Implement this function.

Needs documentation! See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html`

4.948.2.3 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Copy constructs a regex_iterator.

Todo Implement this function.

Needs documentation! See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html`

4.948.3 Member Function Documentation

4.948.3.1 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.948.3.2 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ( )

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.948.3.3 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ( )

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.948.3.4 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (int)

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.948.3.5 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type* std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ( )

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.948.3.6 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.948.3.7 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

4.949.1 Detailed Description

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a std::sub_match object.

Definition at line 2318 of file regex.h.

4.949.2 Constructor & Destructor Documentation

4.949.2.1 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> **std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ( )**

Default constructs a regex_token_iterator.

Todo Implement this function.

A default-constructed regex_token_iterator is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

4.949.2.2 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> **std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (** _Bi_iter *__a,* _Bi_iter *__b,* const **regex_type** & *__re,* int *__submatch =* 0*,* **regex_constants::match_flag_type** *__m =* **regex_constants::match_default)**

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatch	[IN] Which submatch to return. There are some special values for this parameter: • -1 each enumerated subexpression does NOT match the regular expression (aka field splitting) • 0 the entire string matching the subexpression is returned for each match within the text. • >0 enumerates only the indicated subexpression from a match within the text.
__m	[IN] Policy flags for match rules.

Todo Implement this function.

Needs documentation! See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html`

4.949.2.3 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> **std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (** _Bi_iter *__a,* _Bi_iter *__b,* const **regex_type** & *__re,* const **std::vector**< int > & *__submatches,* **regex_constants::match_flag_type** *__m =* **regex_constants::match_default)**

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.949.2.4 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> template<std::size_t _Nm> **std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::**regex_token_iterator** (_Bi_iter *__a,* _Bi_iter *__b,* const **regex_type** & *__re,* const int(&) *__submatches[_Nm],* **regex_constants::match_flag_type** *__m* = **regex_constants::match_default**)

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

Todo Implement this function.

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-_style.html

4.949.2.5 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> **std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::**regex_token_iterator** (const **regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Copy constructs a regex_token_iterator.

Parameters

__rhs	[IN] A regex_token_iterator to copy.

Todo Implement this function.

4.949.3 Member Function Documentation

4.949.3.1 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> bool **std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (const **regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Compares a regex_token_iterator to another for inequality.

Todo Implement this function.

4.949.3.2 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const **value_type**& **std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::operator∗ ( )

Dereferences a regex_token_iterator.

Todo Implement this function.

4.949.3.3 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> **regex_token_iterator& std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ( )

Increments a regex_token_iterator.

Todo Implement this function.

4.949.3.4 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> **regex_token_iterator std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (int)

Postincrements a regex_token_iterator.

Todo Implement this function.

4.949.3.5 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const **value_type**∗ **std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ( )

Selects a regex_token_iterator member.

Todo Implement this function.

4.949.3.6 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> **regex_token_iterator& std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::operator= (const **regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Assigns a regex_token_iterator to another.

Parameters

__rhs	[IN] A regex_token_iterator to copy.

Todo Implement this function.

4.949.3.7 template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> bool **std::regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits >::operator== (const **regex_token_iterator**< _Bi_iter, _Ch_type, _Rx_traits > & *__rhs*)

Compares a regex_token_iterator to another for equality.

Todo Implement this function.

The documentation for this class was generated from the following file:

4.950.1 Detailed Description

template<typename _Ch_type>struct std::regex_traits< _Ch_type >

Class regex_traits. Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class regex is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Definition at line 51 of file regex.h.

4.950.2 Constructor & Destructor Documentation

4.950.2.1 template<typename _Ch_type > std::regex_traits< _Ch_type >::regex_traits ( ) [inline]

Constructs a default traits object.

Definition at line 63 of file regex.h.

4.950.3 Member Function Documentation

4.950.3.1 template<typename _Ch_type > locale_type std::regex_traits< _Ch_type >::getloc ( ) const [inline]

Gets a copy of the current locale in use by the regex_traits object.

Definition at line 270 of file regex.h.

4.950.3.2 template<typename _Ch_type > locale_type std::regex_traits< _Ch_type >::imbue (locale_type __loc) [inline]

Imbues the regex_traits object with a copy of a new locale.

Parameters

__loc	A locale.

Returns

a copy of the previous locale in use by the regex_traits object.

Note

Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this.

Definition at line 259 of file regex.h.

4.950.3.3 template<typename _Ch_type > static std::size_t std::regex_traits< _Ch_type >::length (const char_type * __p) [inline], [static]

Gives the length of a C-style string starting at `__p`.

Parameters

__p	a pointer to the start of a character sequence.

Returns

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

Definition at line 76 of file regex.h.

4.950.3.4 template<typename _Ch_type > template<typename _Fwd_iter > char_class_type std::regex_traits< _Ch_type >::lookup_classname (_Fwd_iter __first, _Fwd_iter __last, bool __icase = false) const [inline]

Maps one or more characters to a named character classification.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.
__icase	ignores the case of the classification name.

Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range [__first, __last). If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, [[:lower:]] is the same as [[:alpha:]]), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s
- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower
- print
- punct
- space
- upper
- xdigit

Todo Implement this function.

Definition at line 215 of file regex.h.

4.950.3.5 template< typename _Ch_type > template< typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::lookup_collatename (_Fwd_iter *__first,* _Fwd_iter *__last*) const [inline]

Gets a collation element by name.

Parameters

__first	beginning of the collation element name.
__last	one-past-the-end of the collation element name.

Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [__first, __last). Returns an empty string if the character sequence is not a valid collating element.

Todo Implement this function.

Definition at line 171 of file regex.h.

4.950.3.6 template<typename _Ch_type > template<typename _Fwd_iter > **string_type std::regex_traits< _Ch_type >::transform** (_Fwd_iter *__first,* _Fwd_iter *__last*) const [inline]

Gets a sort key for a character sequence.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then v.transform(G1, G2) < v.transform(H1, H2).

What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

Returns

a locale-specific sort key equivalent to the input range.

Exceptions

std::bad_cast	if the current locale does not have a collate facet.

Definition at line 129 of file regex.h.

References std::basic_string< _CharT, _Traits, _Alloc >::data(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

4.950.3.7 template<typename _Ch_type > template<typename _Fwd_iter > **string_type std::regex_traits< _Ch_type >::transform_primary** (_Fwd_iter *__first,* _Fwd_iter *__last*) const [inline]

Gets a sort key for a character sequence, independent of case.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.

Effects: if typeid(use_facet<collate<_Ch_type> >) == typeid(collate_byname<_Ch_type>) and the form of the sort key returned by collate_byname<_Ch_type>::transform(__first, __last) is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

Todo Implement this function.

Definition at line 153 of file regex.h.

4.950.3.8 template<typename _Ch_type > char_type **std::regex_traits**< _Ch_type >::translate (char_type *__c*) const [inline]

Performs the identity translation.

Parameters

__c	A character to the locale-specific character set.

Returns

__c.

Definition at line 87 of file regex.h.

4.950.3.9 template<typename _Ch_type > char_type **std::regex_traits**< _Ch_type >::translate_nocase (char_type *__c*) const [inline]

Translates a character into a case-insensitive equivalent.

Parameters

__c	A character to the locale-specific character set.

Returns

the locale-specific lower-case equivalent of __c.

Exceptions

std::bad_cast	if the imbued locale does not support the ctype facet.

Definition at line 100 of file regex.h.

4.958.1 Detailed Description

template<typename _Iterator>class std::reverse_iterator< _Iterator >

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
&*(reverse_iterator(i)) == &*(i - 1)
```

This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

Definition at line 96 of file stl_iterator.h.

4.958.2 Member Typedef Documentation

4.958.2.1 typedef iterator_traits< _Iterator >::iterator_category std::iterator< iterator_traits< _Iterator >::iterator_category , iterator_traits< _Iterator >::value_type , iterator_traits< _Iterator >::difference_type , iterator_traits< _Iterator >::pointer , iterator_traits< _Iterator >::reference >::iterator_category `[inherited]`

One of the tag types.

Definition at line 121 of file stl_iterator_base_types.h.

4.958.2.2 typedef iterator_traits< _Iterator >::value_type std::iterator< iterator_traits< _Iterator >::iterator_category , iterator_traits< _Iterator >::value_type , iterator_traits< _Iterator >::difference_type , iterator_traits< _Iterator >::pointer , iterator_traits< _Iterator >::reference >::value_type `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file stl_iterator_base_types.h.

4.958.3 Constructor & Destructor Documentation

4.958.3.1 template<typename _Iterator> std::reverse_iterator< _Iterator >::reverse_iterator ( ) `[inline]`

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Definition at line 120 of file stl_iterator.h.

Referenced by std::reverse_iterator< _Iterator >::operator+(), and std::reverse_iterator< _Iterator >::operator-().

4.958.3.2 template<typename _Iterator> std::reverse_iterator< _Iterator >::reverse_iterator (iterator_type *__x*) `[inline]`, `[explicit]`

This iterator will move in the opposite direction that `x` does.

Definition at line 126 of file stl_iterator.h.

4.958.3.3 template<typename _Iterator> std::reverse_iterator< _Iterator >::reverse_iterator (const reverse_iterator< _Iterator > & *__x*) `[inline]`

The copy constructor is normal.

Definition at line 131 of file stl_iterator.h.

4.958.3.4 template<typename _Iterator> template<typename _Iter > std::reverse_iterator< _Iterator >::reverse_iterator (const reverse_iterator< _Iter > & *__x*) `[inline]`

A reverse_iterator across other types can be copied if the underlying iterator can be converted to the type of `current`.

Definition at line 139 of file stl_iterator.h.

4.958.4 Member Function Documentation

4.958.4.1 template<typename _Iterator> iterator_type std::reverse_iterator< _Iterator >::base ( ) const `[inline]`

Returns

`current`, the iterator used for underlying work.

Definition at line 146 of file stl_iterator.h.

Referenced by std::operator==().

4.958.4.2 template<typename _Iterator> reference std::reverse_iterator< _Iterator >::operator* ( ) const [inline]

Returns

A reference to the value at `--current`

This requires that `--current` is dereferenceable.

Warning

This implementation requires that for an iterator of the underlying iterator type, `x`, a reference obtained by `*x` remains valid after `x` has been modified or destroyed. This is a bug: http://gcc.gnu.org/PR51823

Definition at line 160 of file stl_iterator.h.

Referenced by std::reverse_iterator< _Iterator >::operator->().

4.958.4.3 template<typename _Iterator> reverse_iterator std::reverse_iterator< _Iterator >::operator+ (difference_type __n) const [inline]

Returns

A reverse_iterator that refers to `current` - *__n*

The underlying iterator must be a Random Access Iterator.

Definition at line 231 of file stl_iterator.h.

References std::reverse_iterator< _Iterator >::reverse_iterator().

4.958.4.4 template<typename _Iterator> reverse_iterator& std::reverse_iterator< _Iterator >::operator++ ( ) [inline]

Returns

`*this`

Decrements the underlying iterator.

Definition at line 181 of file stl_iterator.h.

4.958.4.5 template<typename _Iterator> reverse_iterator std::reverse_iterator< _Iterator >::operator++ (int) [inline]

Returns

The original value of `*this`

Decrements the underlying iterator.

Definition at line 193 of file stl_iterator.h.

4.958.4.6 template<typename _Iterator> reverse_iterator& std::reverse_iterator< _Iterator >::operator+= (difference_type __n) [inline]

Returns

*this

Moves the underlying iterator backwards *__n* steps. The underlying iterator must be a Random Access Iterator.

Definition at line 241 of file stl_iterator.h.

4.958.4.7 template<typename _Iterator> reverse_iterator std::reverse_iterator< _Iterator >::operator- (difference_type __n) const [inline]

Returns

A reverse_iterator that refers to `current` - *__n*

The underlying iterator must be a Random Access Iterator.

Definition at line 253 of file stl_iterator.h.

References std::reverse_iterator< _Iterator >::reverse_iterator().

4.958.4.8 template<typename _Iterator> reverse_iterator& std::reverse_iterator< _Iterator >::operator-- ( ) [inline]

Returns

`*this`

Increments the underlying iterator.

Definition at line 206 of file stl_iterator.h.

4.958.4.9 template<typename _Iterator> reverse_iterator std::reverse_iterator< _Iterator >::operator-- (int) [inline]

Returns

A reverse_iterator with the previous value of `*this`

Increments the underlying iterator.

Definition at line 218 of file stl_iterator.h.

4.958.4.10 template<typename _Iterator> reverse_iterator& std::reverse_iterator< _Iterator >::operator-= (difference_type __n) [inline]

Returns

*this

Moves the underlying iterator forwards *__n* steps. The underlying iterator must be a Random Access Iterator.

Definition at line 263 of file stl_iterator.h.

4.958.4.11 template<typename _Iterator> pointer std::reverse_iterator< _Iterator >::operator-> ( ) const [inline]

Returns

A pointer to the value at `--current`

This requires that `--current` is dereferenceable.

Definition at line 172 of file stl_iterator.h.

References std::reverse_iterator< _Iterator >::operator*().

4.958.4.12 template<typename _Iterator> reference std::reverse_iterator< _Iterator >::operator[] (difference_type __n) const [inline]

Returns

The value at `current` - __*n* - 1

The underlying iterator must be a Random Access Iterator.

Definition at line 275 of file stl_iterator.h.

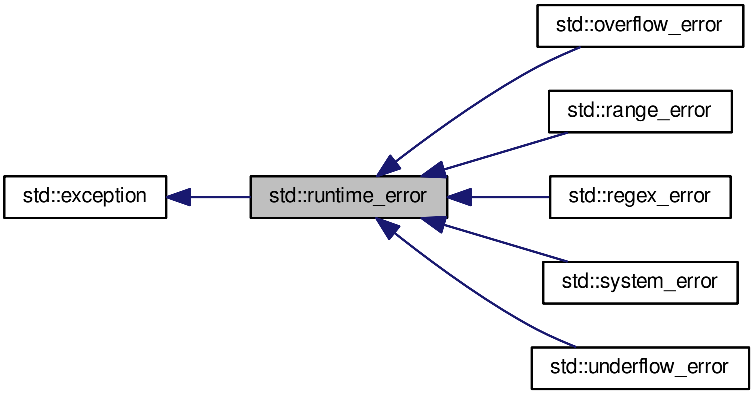
4.959 std::runtime_error Class Reference

Inheritance diagram for std::runtime_error:



Public Member Functions

- runtime_error (const string &__arg)
- virtual const char ∗ what () const noexcept

4.959.1 Detailed Description

One of two subclasses of exception.

Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

Definition at line 112 of file stdexcept.

4.959.2 Constructor & Destructor Documentation

4.959.2.1 std::runtime_error::runtime_error (const string & *__arg*) `[explicit]`

Takes a character string describing the error.

4.959.3 Member Function Documentation

4.959.3.1 virtual const char∗ std::runtime_error::what ( ) const [virtual], [noexcept]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.

The documentation for this class was generated from the following file:

- stdexcept

4.960 std::scoped_allocator_adaptor< _OuterAlloc, _InnerAllocs > Class Template Reference

4.962.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>class std::set< _Key, _Compare, _Alloc >

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, a `reversible container`, and an `associative container` (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (∗_unique versus ∗_equal, same as the standard).

Definition at line 90 of file stl_set.h.

4.962.2 Member Typedef Documentation

4.962.3 Constructor & Destructor Documentation

4.962.3.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::set< _Key, _Compare, _Alloc >::set ( ) `[inline]`

Default constructor creates no elements.

Definition at line 139 of file stl_set.h.

4.962.3.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::set< _Key, _Compare, _Alloc >::set (const _Compare & *__comp*, const allocator_type & *__a* = allocator_type`()`) `[inline]`, `[explicit]`

Creates a set with no elements.

Parameters

__comp	Comparator to use.
__a	An allocator object.

Definition at line 148 of file stl_set.h.

4.962.3.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename _InputIterator > std::set< _Key, _Compare, _Alloc >::set (_InputIterator *__first*, _InputIterator *__last*) `[inline]`

Builds a set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a set consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 163 of file stl_set.h.

4.962.3.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename _InputIterator > std::set< _Key, _Compare, _Alloc >::set (_InputIterator *__first*, _InputIterator *__last*, const _Compare & *__comp*, const allocator_type & *__a* = allocator_type()) [inline]

Builds a set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a set consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

Definition at line 180 of file stl_set.h.

4.962.3.5 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::set< _Key, _Compare, _Alloc >::set (const set< _Key, _Compare, _Alloc > & *__x*) [inline]

Set copy constructor.

Parameters

__x	A set of identical element and allocator types.

The newly-created set uses a copy of the allocation object used by __*x*.

Definition at line 193 of file stl_set.h.

4.962.3.6 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::set< _Key, _Compare, _Alloc >::set (set< _Key, _Compare, _Alloc > && *__x*) [inline], [noexcept]

Set move constructor

Parameters

__x	A set of identical element and allocator types.

The newly-created set contains the exact contents of *x*. The contents of *x* are a valid, but unspecified set.

Definition at line 204 of file stl_set.h.

4.962.3.7 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::set< _Key, _Compare, _Alloc >::set (initializer_list< value_type > *__l*, const _Compare & *__comp* = _Compare(), const allocator_type & *__a* = allocator_type()) [inline]

Builds a set from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).

Definition at line 218 of file stl_set.h.

4.962.4 Member Function Documentation

4.962.4.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 298 of file stl_set.h.

4.962.4.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 335 of file stl_set.h.

4.962.4.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 344 of file stl_set.h.

4.962.4.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void std::set< _Key, _Compare, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 628 of file stl_set.h.

Referenced by std::set< _StateIdT >::operator=().

4.962.4.5 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::set< _Key, _Compare, _Alloc >::count (const key_type & *__x*) const [inline]

Finds the number of elements.

Parameters

__x	Element to located.

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

Definition at line 642 of file stl_set.h.

4.962.4.6 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set< _Key, _Compare, _Alloc >::crbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 353 of file stl_set.h.

4.962.4.7 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set< _Key, _Compare, _Alloc >::crend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 362 of file stl_set.h.

4.962.4.8 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename... _Args> std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::emplace (_Args &&... *__args*) [inline]

Attempts to build and insert an element into the set.

Parameters

__args	Arguments used to generate an element.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 413 of file stl_set.h.

4.962.4.9 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename... _Args> iterator std::set< _Key, _Compare, _Alloc >::emplace_hint (const_iterator *__pos*, _Args &&... *__args*) [inline]

Attempts to insert an element into the set.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from *__args* (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 439 of file stl_set.h.

4.962.4.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> bool std::set< _Key, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the set is empty.

Definition at line 368 of file stl_set.h.

4.962.4.11 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 307 of file stl_set.h.

4.962.4.12 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::pair<iterator, iterator> std::set< _Key, _Compare, _Alloc >::equal_range (const key_type & __x) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 722 of file stl_set.h.

4.962.4.13 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::pair<const_iterator, const_iterator> std::set< _Key, _Compare, _Alloc >::equal_range (const key_type & __x) const [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 726 of file stl_set.h.

4.962.4.14 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::erase (const_iterator *__position*) [inline]

Erases an element from a set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 550 of file stl_set.h.

4.962.4.15 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::set< _Key, _Compare, _Alloc >::erase (const key_type & *__x*) [inline]

Erases elements according to the provided key.

Parameters

__x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 580 of file stl_set.h.

4.962.4.16 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::erase (const_iterator *__first*, const_iterator *__last*) [inline]

Erases a [__first,__last) range of elements from a set.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 601 of file stl_set.h.

4.962.4.17 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::find (const key_type & *__x*) [inline]

Tries to locate an element in a set.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 660 of file stl_set.h.

4.962.4.18 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> const_iterator std::set< _Key, _Compare, _Alloc >::find (const key_type & *__x*) const [inline]

Tries to locate an element in a set.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 664 of file stl_set.h.

4.962.4.19 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Returns the allocator object with which the set was constructed.

Definition at line 289 of file stl_set.h.

4.962.4.20 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::insert (const value_type & __x) [inline]

Attempts to insert an element into the set.

Parameters

__x	Element to be inserted.

Returns

> A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 460 of file stl_set.h.

Referenced by std::set< _StateIdT >::operator=().

4.962.4.21 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::insert (const_iterator __position, const value_type & __x) [inline]

Attempts to insert an element into the set.

Parameters

__position	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

> An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 497 of file stl_set.h.

4.962.4.22 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename _InputIterator > void std::set< _Key, _Compare, _Alloc >::insert (_InputIterator __first, _InputIterator __last) [inline]

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 517 of file stl_set.h.

4.962.4.23 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void std::set< _Key, _Compare, _Alloc >::insert (initializer_list< value_type > __l) [inline]

Attempts to insert a list of elements into the set.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 529 of file stl_set.h.

Referenced by std::set< _StateIdT >::insert().

4.962.4.24 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> key_compare std::set< _Key, _Compare, _Alloc >::key_comp ( ) const [inline]

Returns the comparison object with which the set was constructed.

Definition at line 281 of file stl_set.h.

4.962.4.25 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::lower_bound (const key_type & __x) [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 681 of file stl_set.h.

4.962.4.26 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> const_iterator std::set< _Key, _Compare, _Alloc >::lower_bound (const key_type & __x) const [inline]

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 685 of file stl_set.h.

4.962.4.27 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::set< _Key, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the set.

Definition at line 378 of file stl_set.h.

4.962.4.28 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set& std::set< _Key, _Compare, _Alloc >::operator= (const set< _Key, _Compare, _Alloc > & __x) [inline]

Set assignment operator.

Parameters

__x	A set of identical element and allocator types.

All the elements of *__x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 233 of file stl_set.h.

4.962.4.29 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set& std::set< _Key, _Compare, _Alloc >::operator= (set< _Key, _Compare, _Alloc > && __x) [inline]

Set move assignment operator.

Parameters

__x	A set of identical element and allocator types.

The contents of *__x* are moved into this set (without copying). *__x* is a valid, but unspecified set.

Definition at line 248 of file stl_set.h.

4.962.4.30 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set& std::set< _Key, _Compare, _Alloc >::operator= (initializer_list< value_type > __l) [inline]

Set list assignment operator.

Parameters

__l	An initializer_list.

This function fills a set with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 269 of file stl_set.h.

4.962.4.31 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 316 of file stl_set.h.

4.962.4.32 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set< _Key, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 325 of file stl_set.h.

4.962.4.33 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::set< _Key, _Compare, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the set.

Definition at line 373 of file stl_set.h.

4.962.4.34 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void std::set< _Key, _Compare, _Alloc >::swap (set< _Key, _Compare, _Alloc > & __x) [inline]

Swaps data with another set.

Parameters

__x	A set of the same element and allocator types.

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

Definition at line 393 of file stl_set.h.

Referenced by std::set< _StateIdT >::operator=(), and std::swap().

4.962.4.35 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::set< _Key, _Compare, _Alloc >::upper_bound (const key_type & __x) [inline]

Finds the end of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 697 of file stl_set.h.

4.962.4.36 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> const_iterator std::set< _Key, _Compare, _Alloc >::upper_bound (const key_type & __x) const [inline]

Finds the end of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 701 of file stl_set.h.

4.962.4.37 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> value_compare std::set< _Key, _Compare, _Alloc >::value_comp ( ) const [inline]

Returns the comparison object with which the set was constructed.

Definition at line 285 of file stl_set.h.

4.963.1 Detailed Description

template<typename _Tp>class std::shared_ptr< _Tp >

A smart pointer with reference-counted copy semantics.

The object pointed to is deleted when the last shared_ptr pointing to it is destroyed or reset.

Definition at line 93 of file shared_ptr.h.

4.963.2 Constructor & Destructor Documentation

4.963.2.1 template<typename _Tp> constexpr std::shared_ptr< _Tp >::shared_ptr ( ) `[inline]`, `[noexcept]`

Construct an empty shared_ptr.

Postcondition

use_count()==0 && get()==0

Definition at line 100 of file shared_ptr.h.

4.963.2.2 template<typename _Tp> template<typename _Tp1 > std::shared_ptr< _Tp >::shared_ptr (_Tp1 * __p) `[inline]`, `[explicit]`

Construct a shared_ptr that owns the pointer *__p*.

Parameters

__p	A pointer that is convertible to element_type*.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case `delete` *__p* is called.

Definition at line 112 of file shared_ptr.h.

4.963.2.3 template<typename _Tp> template<typename _Tp1 , typename _Deleter > std::shared_ptr< _Tp >::shared_ptr (_Tp1 * __p, _Deleter __d) `[inline]`

Construct a shared_ptr that owns the pointer *__p* and the deleter *__d*.

Parameters

__p	A pointer.
__d	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw

__shared_ptr will release __p by calling __d(__p)

Definition at line 129 of file shared_ptr.h.

4.963.2.4 template<typename _Tp> template<typename _Deleter > std::shared_ptr< _Tp >::shared_ptr (nullptr_t *__p*, _Deleter *__d*) `[inline]`

Construct a shared_ptr that owns a null pointer and the deleter *__d*.

Parameters

__p	A null pointer constant.
__d	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw

The last owner will call __d(__p)

Definition at line 146 of file shared_ptr.h.

4.963.2.5 template<typename _Tp> template<typename _Tp1 , typename _Deleter , typename _Alloc > std::shared_ptr< _Tp >::shared_ptr (_Tp1 ∗ *__p*, _Deleter *__d*, _Alloc *__a*) `[inline]`

Construct a shared_ptr that owns the pointer *__p* and the deleter *__d*.

Parameters

__p	A pointer.
__d	A deleter.
__a	An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.

__shared_ptr will release __p by calling __d(__p)

Definition at line 165 of file shared_ptr.h.

4.963.2.6 template<typename _Tp> template<typename _Deleter , typename _Alloc > std::shared_ptr< _Tp >::shared_ptr (nullptr_t *__p*, _Deleter *__d*, _Alloc *__a*) `[inline]`

Construct a shared_ptr that owns a null pointer and the deleter *__d*.

Parameters

__p	A null pointer constant.
__d	A deleter.
__a	An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.

The last owner will call __d(__p)

Definition at line 184 of file shared_ptr.h.

4.963.2.7 template<typename _Tp> template<typename _Tp1 > std::shared_ptr< _Tp >::shared_ptr (const shared_ptr< _Tp1 > & *__r*, _Tp ∗ *__p*) `[inline]`, `[noexcept]`

Constructs a shared_ptr instance that stores *__p* and shares ownership with *__r*.

Parameters

__r	A shared_ptr.
__p	A pointer that will remain valid while ∗*__r* is valid.

Postcondition

get() == __p && use_count() == __r.use_count()

This can be used to construct a `shared_ptr` to a sub-object of an object managed by an existing `shared_ptr`.

```
shared_ptr< pair<int,int> > pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

Definition at line 206 of file shared_ptr.h.

4.963.2.8 template<typename _Tp> template<typename _Tp1 , typename = typename std::enable_if<std::is_convertible<_Tp1∗, _Tp∗>::value>::type> std::shared_ptr< _Tp >::shared_ptr (const shared_ptr< _Tp1 > & *__r*) `[inline]`, `[noexcept]`

If *__r* is empty, constructs an empty shared_ptr; otherwise construct a shared_ptr that shares ownership with *__r*.

Parameters

__r	A shared_ptr.

Postcondition

get() == __r.get() && use_count() == __r.use_count()

Definition at line 218 of file shared_ptr.h.

4.963.2.9 template<typename _Tp> std::shared_ptr< _Tp >::shared_ptr (shared_ptr< _Tp > && *__r*) [inline], [noexcept]

Move-constructs a shared_ptr instance from __*r*.

Parameters

__r	A shared_ptr rvalue.

Postcondition

∗this contains the old value of __*r*, __*r* is empty.

Definition at line 226 of file shared_ptr.h.

4.963.2.10 template<typename _Tp> template<typename _Tp1 , typename = typename std::enable_if<std::is_convertible<_Tp1∗, _Tp∗>::value>::type> std::shared_ptr< _Tp >::shared_ptr (shared_ptr< _Tp1 > && *__r*) [inline], [noexcept]

Move-constructs a shared_ptr instance from __*r*.

Parameters

__r	A shared_ptr rvalue.

Postcondition

∗this contains the old value of __*r*, __*r* is empty.

Definition at line 236 of file shared_ptr.h.

4.963.2.11 template<typename _Tp> template<typename _Tp1 > std::shared_ptr< _Tp >::shared_ptr (const weak_ptr< _Tp1 > & *__r*) [inline], [explicit]

Constructs a shared_ptr that shares ownership with __*r* and stores a copy of the pointer stored in __*r*.

Parameters

__r	A weak_ptr.

Postcondition

use_count() == __r.use_count()

Exceptions

bad_weak_ptr	when __r.expired(), in which case the constructor has no effect.

Definition at line 248 of file shared_ptr.h.

4.963.2.12 template<typename _Tp> constexpr std::shared_ptr< _Tp >::shared_ptr (nullptr_t *__p*) [inline], [noexcept]

Construct an empty shared_ptr.

Parameters

__p	A null pointer constant.

Postcondition

use_count() == 0 && get() == nullptr

Definition at line 265 of file shared_ptr.h.

4.963.3 Friends And Related Function Documentation

4.963.3.1 template<typename _Tp> template<typename _Tp1 , typename _Alloc , typename... _Args> shared_ptr<_Tp1> allocate_shared (const _Alloc & *__a*, _Args &&... *__args*) [friend]

Create an object that is owned by a shared_ptr.

Parameters

__a	An allocator.
__args	Arguments for the *_Tp* object's constructor.

Returns

A shared_ptr that owns the newly created object.

Exceptions

An	exception thrown from *_Alloc::allocate* or from the constructor of *_Tp*.

A copy of *__a* will be used to allocate memory for the shared_ptr and the new object.

Definition at line 595 of file shared_ptr.h.

  _Traits > & operator>> (std::basic_istream< _CharT, _Traits > &__is, std::shuffle_order_engine< _RandomNumberEngine1, __k1 > &__x)

4.964.1 Detailed Description

template<typename _RandomNumberEngine, size_t __k>class std::shuffle_order_engine< _RandomNumberEngine, __k >

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits `__w`.

Definition at line 1292 of file random.h.

4.964.2 Member Typedef Documentation

4.964.2.1 template<typename _RandomNumberEngine, size_t __k> typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::result_type

The type of the generated random value.

Definition at line 1295 of file random.h.

4.964.3 Constructor & Destructor Documentation

4.964.3.1 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine ( ) `[inline]`

Constructs a default shuffle_order_engine engine.

The underlying engine is default constructed as well.

Definition at line 1308 of file random.h.

4.964.3.2 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (const _RandomNumberEngine & *__rng*) `[inline]`, `[explicit]`

Copy constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 1319 of file random.h.

4.964.3.3 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (_RandomNumberEngine && *__rng*) `[inline]`, `[explicit]`

Move constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 1330 of file random.h.

4.964.3.4 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (result_type *__s*) `[inline]`, `[explicit]`

Seed constructs a shuffle_order_engine engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

__s	A seed value for the base class engine.

Definition at line 1341 of file random.h.

4.964.3.5 template<typename _RandomNumberEngine, size_t __k> template<typename _Sseq , typename = typename std::enable_if<!std::is_same<_Sseq, shuffle_order_engine>::value && !std::is_same<_Sseq, _RandomNumberEngine>::value> ::type> std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (_Sseq & *__q*) `[inline]`, `[explicit]`

Generator construct a shuffle_order_engine engine.

Parameters

__q	A seed sequence.

Definition at line 1355 of file random.h.

4.964.4 Member Function Documentation

4.964.4.1 template<typename _RandomNumberEngine, size_t __k> const _RandomNumberEngine& std::shuffle_order_engine< _RandomNumberEngine, __k >::base ( ) const `[inline]`, `[noexcept]`

Gets a const reference to the underlying generator engine object.

Definition at line 1398 of file random.h.

4.964.4.2 template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard (unsigned long long *__z*) `[inline]`

Discard a sequence of random numbers.

Definition at line 1419 of file random.h.

4.964.4.3 template<typename _RandomNumberEngine, size_t __k> static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max ( ) `[inline]`, `[static]`

Definition at line 1412 of file random.h.

References std::max().

4.964.4.4 template<typename _RandomNumberEngine, size_t __k> static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min ( ) `[inline]`, `[static]`

Gets the minimum value in the generated random number range.

Definition at line 1405 of file random.h.

References std::min().

4.964.4.5 template<typename _RandomNumberEngine , size_t __k> shuffle_order_engine< _RandomNumberEngine, __k >::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::operator() ( )

Gets the next value in the generated random number sequence.

Definition at line 818 of file bits/random.tcc.

4.964.4.6 template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed ( ) `[inline]`

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.

Definition at line 1364 of file random.h.

4.964.4.7 template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (result_type __s) [inline]

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.

Definition at line 1375 of file random.h.

4.964.4.8 template<typename _RandomNumberEngine, size_t __k> template<typename _Sseq > void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (_Sseq & __q) [inline]

Reseeds the shuffle_order_engine object with the given seed sequence.

Parameters

__q	A seed generator function.

Definition at line 1388 of file random.h.

4.964.5 Friends And Related Function Documentation

4.964.5.1 template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1 , size_t __k1, typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]

Inserts the current state of a shuffle_order_engine random number generator engine `__x` into the output stream `__os`.

Parameters

__os	An output stream.
__x	A shuffle_order_engine random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.964.5.2 template<typename _RandomNumberEngine, size_t __k> bool operator== (const shuffle_order_engine< _RandomNumberEngine, __k > & __lhs, const shuffle_order_engine< _RandomNumberEngine, __k > & __rhs) [friend]

Compares two shuffle_order_engine random number generator objects of the same type for equality.

Parameters

__lhs	A shuffle_order_engine random number generator object.
__rhs	Another shuffle_order_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1443 of file random.h.

4.964.5.3 template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1 , size_t __k1, typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & __is, std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]

Extracts the current state of a % subtract_with_carry_engine random number generator engine `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A shuffle_order_engine random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

4.965 std::slice Class Reference

Public Member Functions

- slice ()
- slice (size_t __o, size_t __d, size_t __s)
- size_t size () const
- size_t start () const
- size_t stride () const

4.965.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

Definition at line 59 of file slice_array.h.

The documentation for this class was generated from the following file:

Friends

- class **valarray< _Tp >**

4.966.1 Detailed Description

template<typename _Tp>class std::slice_array< _Tp >

Reference to one-dimensional subset of an array.

A slice_array is a reference to the actual elements of an array specified by a slice. The way to get a slice_array is to call operator[](slice) on a valarray. The returned slice_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice_array refers to.

Parameters

Tp	Element type.

Definition at line 123 of file slice_array.h.

The documentation for this class was generated from the following file:

- slice_array.h

4.967.1 Detailed Description

template<typename _Tp, typename _Sequence = deque<_Tp>>class std::stack< _Tp, _Sequence >

A standard container giving FILO behavior.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to deque<_Tp>.

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to std::deque, but it can be any type that supports `back`, `push_back`, and `pop_front`, such as std::list, std::vector, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

Definition at line 96 of file stl_stack.h.

4.967.2 Constructor & Destructor Documentation

4.967.2.1 template<typename _Tp, typename _Sequence = deque<_Tp>> std::stack< _Tp, _Sequence >::stack (const _Sequence & __c) [inline], [explicit]

Default constructor creates no elements.

Definition at line 134 of file stl_stack.h.

4.967.3 Member Function Documentation

4.967.3.1 template<typename _Tp, typename _Sequence = deque<_Tp>> bool std::stack< _Tp, _Sequence >::empty ( ) const [inline]

Returns true if the stack is empty.

Definition at line 146 of file stl_stack.h.

4.967.3.2 template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack< _Tp, _Sequence >::pop ( ) [inline]

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 212 of file stl_stack.h.

4.967.3.3 template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack< _Tp, _Sequence >::push (const value_type & __x) [inline]

Add data to the top of the stack.

Parameters

__x	Data to be added.

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 186 of file stl_stack.h.

4.967.3.4 template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::stack< _Tp, _Sequence >::size ( ) const [inline]

Returns the number of elements in the stack.

Definition at line 151 of file stl_stack.h.

4.967.3.5 template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::stack< _Tp, _Sequence >::top ( ) [inline]

Returns a read/write reference to the data at the first element of the stack.

Definition at line 159 of file stl_stack.h.

4.967.3.6 template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::stack< _Tp, _Sequence >::top ( ) const [inline]

Returns a read-only (constant) reference to the data at the first element of the stack.

Definition at line 170 of file stl_stack.h.

The documentation for this class was generated from the following file:

4.970.1 Detailed Description

template<typename _BiIter>class std::sub_match< _BiIter >

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with std::basic_string objects of a similar base character type as the pattern matched by the regular expression.

The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Definition at line 741 of file regex.h.

4.970.2 Member Typedef Documentation

4.970.2.1 typedef _BIter std::pair< _BIter , _BIter >::second_type [inherited]

`first_type` is the first bound type

Definition at line 99 of file stl_pair.h.

4.970.3 Member Function Documentation

4.970.3.1 template<typename _BiIter> int std::sub_match< _BiIter >::compare (const sub_match< _BiIter > & __s) const [inline]

Compares this and another matched sequence.

Parameters

__s	Another matched sequence to compare to this one.

Return values

<0	this matched sequence will collate before `__s`.
=0	this matched sequence is equivalent to `__s`.
<0	this matched sequence will collate after `__s`.

Definition at line 802 of file regex.h.

Referenced by std::operator!=(), std::operator<(), std::operator<=(), std::operator==(), std::operator>(), and std::operator>=().

4.970.3.2 template<typename _BiIter> int **std::sub_match**< _BiIter >::compare (const **string_type** & *__s*) const `[inline]`

Compares this sub_match to a string.

Parameters

__s	A string to compare to this sub_match.

Return values

<0	this matched sequence will collate before `__s`.
=0	this matched sequence is equivalent to `__s`.
<0	this matched sequence will collate after `__s`.

Definition at line 815 of file regex.h.

4.970.3.3 template<typename _BiIter> int **std::sub_match**< _BiIter >::compare (const value_type * *__s*) const `[inline]`

Compares this sub_match to a C-style string.

Parameters

__s	A C-style string to compare to this sub_match.

Return values

<0	this matched sequence will collate before `__s`.
=0	this matched sequence is equivalent to `__s`.
<0	this matched sequence will collate after `__s`.

Definition at line 828 of file regex.h.

4.970.3.4 template<typename _BiIter> difference_type **std::sub_match**< _BiIter >::length ( ) const `[inline]`

Gets the length of the matching sequence.

Definition at line 759 of file regex.h.

4.970.3.5 template<typename _BiIter> **std::sub_match**< _BiIter >::operator **string_type** ( ) const `[inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the str() member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

Definition at line 772 of file regex.h.

4.970.3.6 template<typename _BiIter> **string_type** **std::sub_match**< _BiIter >::str ( ) const `[inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

Definition at line 785 of file regex.h.

Referenced by std::sub_match< _Bi_iter >::compare(), and std::operator<<().

4.975.1 Detailed Description

template<typename _CharT, typename _InIter>class std::time_get< _CharT, _InIter >

Primary class template time_get.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The time_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_get facet.

Definition at line 368 of file locale_facets_nonio.h.

4.975.2 Member Typedef Documentation

4.975.3 Constructor & Destructor Documentation

4.975.3.1 template<typename _CharT , typename _InIter > std::time_get< _CharT, _InIter >::time_get (size_t *__refs* = 0) [inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 390 of file locale_facets_nonio.h.

4.975.3.2 template<typename _CharT , typename _InIter > virtual std::time_get< _CharT, _InIter >::~time_get ( ) [inline], [protected], [virtual]

Destructor.

Definition at line 546 of file locale_facets_nonio.h.

4.975.4 Member Function Documentation

4.975.4.1 template<typename _CharT , typename _InIter > dateorder std::time_get< _CharT, _InIter >::date_order ( ) const [inline]

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns timebase::dateorder::noorder.

NOTE: The library always returns noorder at the moment.

Returns

A member of timebase::dateorder.

Definition at line 407 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_date_order().

4.975.4.2 template<typename _CharT , typename _InIter > time_base::dateorder std::time_get< _CharT, _InIter >::do_date_order ( ) const [protected], [virtual]

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of timebase::dateorder.

Definition at line 620 of file locale_facets_nonio.tcc.

Referenced by std::time_get< _CharT, _InIter >::date_order().

4.975.4.3 template<typename _CharT , typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_date (iter_type *__beg*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, tm * *__tm*) const [protected], [virtual]

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_date() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1047 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::ios_base::eofbit.

Referenced by std::time_get< _CharT, _InIter >::get_date().

4.975.4.4 template<typename _CharT , typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_monthname (iter_type *__beg*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, tm * *__tm*) const [protected], [virtual]

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_monthname() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1092 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

Referenced by std::time_get< _CharT, _InIter >::get_monthname().

4.975.4.5 template<typename _CharT , typename _InIter > _InIter **std::time_get< _CharT, _InIter >::do_get_time (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm * *__tm*) const [protected], [virtual]

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_time() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1030 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::ios_base::eofbit.

Referenced by std::time_get< _CharT, _InIter >::get_time().

4.975.4.6 template<typename _CharT , typename _InIter > _InIter **std::time_get< _CharT, _InIter >::do_get_weekday (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm * *__tm*) const [protected], [virtual]

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_weekday() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.

__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1064 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

Referenced by std::time_get< _CharT, _InIter >::get_weekday().

4.975.4.7 template<typename _CharT , typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_year (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const `[protected]`, `[virtual]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_year() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1120 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

Referenced by std::time_get< _CharT, _InIter >::get_year().

4.975.4.8 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_date (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const `[inline]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_date().

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 456 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_date().

4.975.4.9 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_monthname (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const [inline]

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_monthname().

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 513 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_monthname().

4.975.4.10 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_time (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const [inline]

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_time().

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 431 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_time().

4.975.4.11 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_weekday (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const [inline]

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 484 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_weekday().

4.975.4.12 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_year (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const [inline]

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 539 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_year().

4.976.1 Detailed Description

template<typename _CharT, typename _InIter>class std::time_get_byname< _CharT, _InIter >

class time_get_byname [22.2.5.2].

Definition at line 686 of file locale_facets_nonio.h.

4.976.2 Member Function Documentation

4.976.2.1 template<typename _CharT , typename _InIter > dateorder std::time_get< _CharT, _InIter >::date_order ( ) const [inline], [inherited]

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns timebase::dateorder::noorder.

NOTE: The library always returns noorder at the moment.

Returns

A member of timebase::dateorder.

Definition at line 407 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_date_order().

4.976.2.2 template<typename _CharT , typename _InIter > time_base::dateorder std::time_get< _CharT, _InIter >::do_date_order ( ) const [protected], [virtual], [inherited]

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of timebase::dateorder.

Definition at line 620 of file locale_facets_nonio.tcc.

Referenced by std::time_get< _CharT, _InIter >::date_order().

4.976.2.3 template<typename _CharT , typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_date (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [protected], [virtual], [inherited]

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_date() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1047 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::ios_base::eofbit.

Referenced by std::time_get< _CharT, _InIter >::get_date().

4.976.2.4 template<typename _CharT , typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_monthname (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [protected], [virtual], [inherited]

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_monthname() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1092 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

Referenced by std::time_get< _CharT, _InIter >::get_monthname().

4.976.2.5 template<typename _CharT , typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_time (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const [protected], [virtual], [inherited]

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_time() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1030 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::ios_base::eofbit.

Referenced by std::time_get< _CharT, _InIter >::get_time().

4.976.2.6 template<typename _CharT , typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_weekday (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm ∗ *__tm*) const [protected], [virtual], [inherited]

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_weekday() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.

__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1064 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

Referenced by std::time_get< _CharT, _InIter >::get_weekday().

4.976.2.7 template<typename _CharT , typename _InIter > _InIter **std::time_get**< _CharT, _InIter >::do_get_year (**iter_type** *__beg,* **iter_type** *__end,* **ios_base &** *__io,* **ios_base::iostate &** *__err,* tm * *__tm*) const `[protected]`, `[virtual]`, `[inherited]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

get_year() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1120 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

Referenced by std::time_get< _CharT, _InIter >::get_year().

4.976.2.8 template<typename _CharT , typename _InIter > iter_type **std::time_get**< _CharT, _InIter >::get_date (**iter_type** *__beg,* **iter_type** *__end,* **ios_base &** *__io,* **ios_base::iostate &** *__err,* tm * *__tm*) const `[inline]`, `[inherited]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_date().

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 456 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_date().

4.976.2.9 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_monthname (iter_type *__beg*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, tm * *__tm*) const [inline], [inherited]

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_monthname().

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 513 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_monthname().

4.976.2.10 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_time (iter_type *__beg*, iter_type *__end*, ios_base & *__io*, ios_base::iostate & *__err*, tm * *__tm*) const [inline], [inherited]

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_time().

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 431 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_time().

4.976.2.11 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_weekday (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm * *__tm*) const [inline], [inherited]

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 484 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_weekday().

4.976.2.12 template<typename _CharT , typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_year (iter_type *__beg,* iter_type *__end,* ios_base & *__io,* ios_base::iostate & *__err,* tm * *__tm*) const [inline], [inherited]

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 539 of file locale_facets_nonio.h.

References std::time_get< _CharT, _InIter >::do_get_year().

4.977.1 Detailed Description

template<typename _CharT, typename _OutIter>class std::time_put< _CharT, _OutIter >

Primary class template time_put.

This facet encapsulates the code to format and output dates and times according to formats used by strftime().

The time_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_put facet.

Definition at line 715 of file locale_facets_nonio.h.

4.977.2 Member Typedef Documentation

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See Also

put() for more details.

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__format	Format char.
__mod	Optional modifier char.

Returns

Iterator after writing.

Definition at line 1178 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::__ctype_abstract_base< _CharT >::widen().

Referenced by std::time_put< _CharT, _OutIter >::put().

4.977.4.2 template<typename _CharT , typename _OutIter > _OutIter std::time_put< _CharT, _OutIter >::put (iter_type *__s*, ios_base & *__io*, char_type *__fill*, const tm * *__tm*, const _CharT * *__beg*, const _CharT * *__end*) const

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__beg	Start of format string.
__end	End of format string.

Returns

Iterator after writing.

Definition at line 1143 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::__ctype_abstract_base< _CharT >::narrow().

4.983.1 Detailed Description

bool_set

See N2136, Bool_set: multi-valued logic by Hervnnimann, Guillaume Melquiond, Sylvain Pion.

The implicit conversion to bool is slippery! I may use the new explicit conversion. This has been specialized in the language so that in contexts requiring a bool the conversion happens implicitly. Thus most objections should be eliminated.

Definition at line 54 of file bool_set.

4.983.2 Constructor & Destructor Documentation

4.985.1 Detailed Description

template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>class std::tr2::dynamic_bitset< _WordT, _Alloc >

The dynamic_bitset class represents a sequence of bits.

(Note that dynamic_bitset does *not* meet the formal requirements of a `container`. Mainly, it lacks iterators.)

The template argument, *Nb*, may be any non-negative number, specifying the number of bits (e.g., "0", "12", "1024∗1024").

In the general unoptimized case, storage is allocated in word-sized blocks. Let B be the number of bits in a word, then (Nb+(B-1))/B words will be used for storage. B - NbB bits are unused. (They are the high-order bits in the highest word.) It is a class invariant that those unused bits are always zero.

If you think of dynamic_bitset as "a simple array of bits," be aware that your mental picture is reversed: a dynamic_bitset behaves the same way as bits in integers do, with the bit at index 0 in the "least significant / right-hand" position, and the bit at index Nb-1 in the "most significant / left-hand" position. Thus, unlike other containers, a dynamic_bitset's index "counts from right to left," to put it very loosely.

This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints "b('a') is 0001100001" on a modern ASCII system.

```
#include <dynamic_bitset>
#include <iostream>
#include <sstream>

using namespace std;

int main()
{
    long         a = 'a';
    dynamic_bitset   b(a);

    cout << "b('a') is " << b << endl;

    ostringstream s;
    s << b;
    string  str = s.str();
    cout << "index 3 in the string is " << str[3] << " but\n"
         << "index 3 in the bitset is " << b[3] << endl;
}
```

Also see: `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt12ch33s02.html` for a description of extensions.

Most of the actual code isn't contained in dynamic_bitset<> itself, but in the base class __dynamic_bitset_base. The base class works with whole words, not with individual bits. This allows us to specialize __dynamic_bitset_base for the important special case where the dynamic_bitset is only a single word.

Extra confusion can result due to the fact that the storage for __dynamic_bitset_base *is* a vector, and is indexed as such. This is carefully encapsulated.

Definition at line 569 of file dynamic_bitset.

4.985.2 Constructor & Destructor Documentation

4.985.2.1 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (const allocator_type & *__alloc* = `allocator_type()`) `[inline]`, `[explicit]`

All bits set to zero.

Definition at line 721 of file dynamic_bitset.

4.985.2.2 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (size_type __nbits, unsigned long long __val = `0ULL`, const allocator_type & __alloc = `allocator_type()`) `[inline]`, `[explicit]`

Initial bits bitwise-copied from a single word (others set to zero).

Definition at line 727 of file dynamic_bitset.

4.985.2.3 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> template<typename _CharT , typename _Traits , typename _Alloc1 > std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (const std::basic_string< _CharT, _Traits, _Alloc1 > & __str, typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __pos = `0`, typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __n = std::basic_string<`_CharT, _Traits, _Alloc1`>`::npos`, _CharT __zero = `_CharT('0')`, _CharT __one = `_CharT('1')`, const allocator_type & __alloc = `allocator_type()`) `[inline]`, `[explicit]`

Use a subset of a string.

Parameters

__str	A string of '0' and '1' characters.
__pos	Index of the first character in `__str` to use.
__n	The number of characters to copy.

Exceptions

std::out_of_range	If `__pos` is bigger the size of `__str`.
std::invalid_argument	If a character appears in the string which is neither '0' nor '1'.

Definition at line 749 of file dynamic_bitset.

References std::tr2::dynamic_bitset< _WordT, _Alloc >::resize(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

4.985.2.4 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (const char * __str, const allocator_type & __alloc = `allocator_type()`) `[inline]`, `[explicit]`

Construct from a string.

Parameters

__str	A string of '0' and '1' characters.

Exceptions

std::invalid_argument	If a character appears in the string which is neither '0' nor '1'.

Definition at line 777 of file dynamic_bitset.

References std::tr2::dynamic_bitset< _WordT, _Alloc >::resize().

4.985.2.5 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (const dynamic_bitset< _WordT, _Alloc > & __b) `[inline]`

Copy constructor.

Definition at line 793 of file dynamic_bitset.

4.985.2.6 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (dynamic_bitset< _WordT, _Alloc > && *__b*) [inline]

Move constructor.

Definition at line 800 of file dynamic_bitset.

4.985.3 Member Function Documentation

4.985.3.1 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool std::tr2::dynamic_bitset< _WordT, _Alloc >::all ( ) const [inline]

Tests whether all the bits are on.

Returns

True if all the bits are set.

Definition at line 1187 of file dynamic_bitset.

4.985.3.2 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool std::tr2::dynamic_bitset< _WordT, _Alloc >::any ( ) const [inline]

Tests whether any of the bits are on.

Returns

True if at least one bit is set.

Definition at line 1195 of file dynamic_bitset.

4.985.3.3 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (block_type *__block*) [inline]

Append a block.

Definition at line 881 of file dynamic_bitset.

Referenced by std::tr2::dynamic_bitset< _WordT, _Alloc >::append().

4.985.3.4 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> template<typename _BlockInputIterator > void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (_BlockInputIterator *__first,* _BlockInputIterator *__last*) [inline]

Append an iterator range of blocks.

Definition at line 899 of file dynamic_bitset.

References std::tr2::dynamic_bitset< _WordT, _Alloc >::append().

4.985.3.5 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void std::tr2::dynamic_bitset< _WordT, _Alloc >::clear ( ) [inline]

Clear the bitset.

Definition at line 859 of file dynamic_bitset.

4.985.3.6 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::count ( ) const [inline], [noexcept]

Returns the number of bits which are set.

Definition at line 1143 of file dynamic_bitset.

4.985.3.7 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool std::tr2::dynamic_bitset< _WordT, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the dynamic_bitset is empty.

Definition at line 1158 of file dynamic_bitset.

4.985.3.8 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_first ( ) const [inline]

Finds the index of the first "on" bit.

Returns

The index of the first bit set, or size() if not found.

See Also

find_next

Definition at line 1223 of file dynamic_bitset.

4.985.3.9 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_next (size_t *__prev*) const [inline]

Finds the index of the next "on" bit after prev.

Returns

The index of the next bit set, or size() if not found.

Parameters

__prev	Where to start searching.

See Also

find_first

Definition at line 1233 of file dynamic_bitset.

4.985.3.10 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::flip ( ) [inline]

Toggles every bit to its opposite value.

Definition at line 1038 of file dynamic_bitset.

Referenced by std::tr2::dynamic_bitset< _WordT, _Alloc >::operator∼().

4.985.3.11 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::flip (size_type __pos) [inline]

Toggles a given bit to its opposite value.

Parameters

__pos	The index of the bit.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

Definition at line 1051 of file dynamic_bitset.

4.985.3.12 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> allocator_type std::tr2::dynamic_bitset< _WordT, _Alloc >::get_allocator ( ) const [inline]

Return the allocator for the bitset.

Definition at line 841 of file dynamic_bitset.

4.985.3.13 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> constexpr size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::max_size ( ) [inline], [noexcept]

Returns the maximum size of a dynamic_bitset object having the same type as ∗this. The real answer is max() ∗ bits_per_block but is likely to overflow.

Definition at line 1165 of file dynamic_bitset.

References std::numeric_limits< _Tp >::max().

4.985.3.14 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool std::tr2::dynamic_bitset< _WordT, _Alloc >::none ( ) const [inline]

Tests whether any of the bits are on.

Returns

True if none of the bits are set.

Definition at line 1203 of file dynamic_bitset.

4.985.3.15 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::num_blocks ( ) const [inline], [noexcept]

Returns the total number of blocks.

Definition at line 1153 of file dynamic_bitset.

4.985.3.16 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.

Definition at line 914 of file dynamic_bitset.

4.985.3.17 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (dynamic_bitset< _WordT, _Alloc > && *__rhs*) [inline]

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.

Definition at line 921 of file dynamic_bitset.

4.985.3.18 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator-= (const dynamic_bitset< _WordT, _Alloc > & *__rhs*) [inline]

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.

Definition at line 942 of file dynamic_bitset.

4.985.3.19 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc> std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<< (size_type *__pos*) const [inline]

Self-explanatory.

Definition at line 1209 of file dynamic_bitset.

4.985.3.20 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<<= (size_type *__pos*) [inline]

Operations on dynamic_bitsets.

Parameters

__pos	The number of places to shift.

These should be self-explanatory.

Definition at line 957 of file dynamic_bitset.

4.985.3.21 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (const dynamic_bitset< _WordT, _Alloc > & __b) [inline]

Assignment.

Definition at line 818 of file dynamic_bitset.

4.985.3.22 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (dynamic_bitset< _WordT, _Alloc > && __b) [inline]

Move assignment.

Definition at line 831 of file dynamic_bitset.

References std::tr2::dynamic_bitset< _WordT, _Alloc >::swap().

4.985.3.23 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc> std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>> (size_type __pos) const [inline]

Self-explanatory.

Definition at line 1213 of file dynamic_bitset.

4.985.3.24 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>>= (size_type __pos) [inline]

Operations on dynamic_bitsets.

Parameters

__pos	The number of places to shift.

These should be self-explanatory.

Definition at line 970 of file dynamic_bitset.

4.985.3.25 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (size_type __pos) [inline]

Array-indexing support.

Parameters

__pos	Index into the dynamic_bitset.

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

Definition at line 1073 of file dynamic_bitset.

4.985.3.26 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> const_reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (size_type __pos) const [inline]

Array-indexing support.

Parameters

__pos	Index into the dynamic_bitset.

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

Definition at line 1077 of file dynamic_bitset.

4.985.3.27 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator^= (const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.

Definition at line 935 of file dynamic_bitset.

4.985.3.28 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator|= (const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.

Definition at line 928 of file dynamic_bitset.

4.985.3.29 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc> std::tr2::dynamic_bitset< _WordT, _Alloc >::operator~ ( ) const [inline]

See the no-argument flip().

Definition at line 1060 of file dynamic_bitset.

References std::tr2::dynamic_bitset< _WordT, _Alloc >::flip().

4.985.3.30 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back (bool __bit) [inline]

Push a bit onto the high end of the bitset.

Definition at line 869 of file dynamic_bitset.

References std::tr2::dynamic_bitset< _WordT, _Alloc >::size().

4.985.3.31 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::reset ( ) [inline]

Sets every bit to false.

Definition at line 1013 of file dynamic_bitset.

4.985.3.32 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::reset (size_type __pos) [inline]

Sets a given bit to false.

Parameters

__pos	The index of the bit.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

Same as writing `set(__pos, false)`.

Definition at line 1027 of file dynamic_bitset.

4.985.3.33 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void std::tr2::dynamic_bitset< _WordT, _Alloc >::resize (size_type __nbits, bool __value = false) [inline]

Resize the bitset.

Definition at line 848 of file dynamic_bitset.

Referenced by std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset(), and std::tr2::operator>>().

4.985.3.34 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::set ( ) [inline]

Sets every bit to true.

Definition at line 988 of file dynamic_bitset.

4.985.3.35 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset< _WordT, _Alloc >::set (size_type __pos, bool __val = true) [inline]

Sets a given bit to a particular value.

Parameters

__pos	The index of the bit.
__val	Either true or false, defaults to true.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

Definition at line 1002 of file dynamic_bitset.

4.985.3.36 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::size ( ) const [inline], [noexcept]

Returns the total number of bits.

Definition at line 1148 of file dynamic_bitset.

Referenced by std::tr2::operator>>(), and std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back().

4.985.3.37 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void std::tr2::dynamic_bitset< _WordT, _Alloc >::swap (dynamic_bitset< _WordT, _Alloc > & __b) [inline]

Swap with another bitset.

Definition at line 808 of file dynamic_bitset.

Referenced by std::tr2::dynamic_bitset< _WordT, _Alloc >::operator=().

4.985.3.38 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool std::tr2::dynamic_bitset< _WordT, _Alloc >::test (size_type __pos) const [inline]

Tests the value of a bit.

Parameters

__pos	The index of a bit.

Returns

The value at *__pos*.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

Definition at line 1175 of file dynamic_bitset.

4.985.3.39 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> template<typename _CharT = char, typename _Traits = std::char_traits<_CharT>, typename _Alloc1 = std::allocator<_CharT>> std::basic_string<_CharT, _Traits, _Alloc1> std::tr2::dynamic_bitset< _WordT, _Alloc >::to_string (_CharT __zero = _CharT('0'), _CharT __one = _CharT('1')) const [inline]

Returns a character interpretation of the dynamic_bitset.

Returns

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

Definition at line 1113 of file dynamic_bitset.

4.985.3.40 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> unsigned long long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ullong ( ) const [inline]

Returns a numerical interpretation of the dynamic_bitset.

Returns

The integral equivalent of the bits.

Exceptions

std::overflow_error	If there are too many bits to be represented in an `unsigned long`.

Definition at line 1098 of file dynamic_bitset.

4.985.3.41 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> unsigned long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ulong ( ) const [inline]

Returns a numerical interpretation of the dynamic_bitset.

Returns

The integral equivalent of the bits.

Exceptions

std::overflow_error	If there are too many bits to be represented in an `unsigned long`.

Definition at line 1088 of file dynamic_bitset.

4.986.1 Detailed Description

template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>class std::tr2::dynamic_bitset< _WordT, _Alloc >::reference

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this "bit %reference" is 64 times the size of an actual bit. Ha.)

Definition at line 654 of file dynamic_bitset.

The documentation for this class was generated from the following file:

- dynamic_bitset

4.987 std::try_to_lock_t Struct Reference

4.987.1 Detailed Description

Try to acquire ownership of the mutex without blocking.

Protected Attributes

- const char ∗ **__name**

4.994.1 Detailed Description

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

Definition at line 88 of file typeinfo.

4.994.2 Constructor & Destructor Documentation

4.994.2.1 virtual std::type_info::∼type_info ( ) `[virtual]`

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated type_info structures in the new-abi.

4.994.3 Member Function Documentation

4.994.3.1 const char∗ std::type_info::name ( ) const `[inline]`, `[noexcept]`

Returns an *implementation-defined* byte string; this is not portable between compilers!

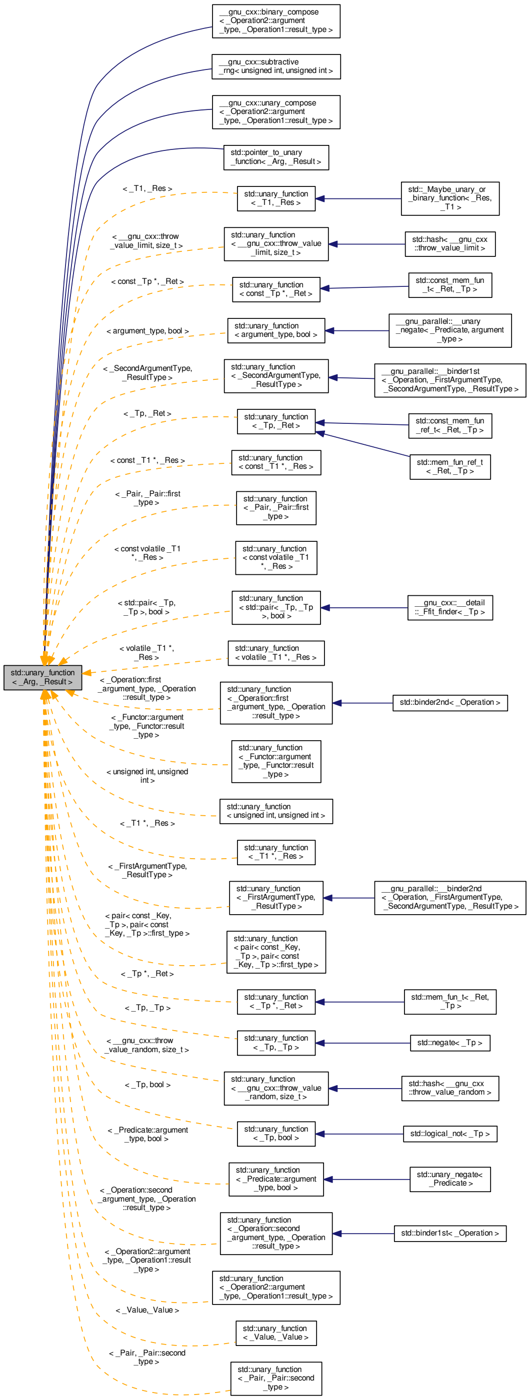
Definition at line 99 of file typeinfo.

The documentation for this class was generated from the following file:

- typeinfo

4.995 std::unary_function< _Arg, _Result > Struct Template Reference

Inheritance diagram for std::unary_function< _Arg, _Result >:



Public Types

- typedef _Arg argument_type
- typedef _Result result_type

4.995.1 Detailed Description

template<typename _Arg, typename _Result>struct std::unary_function< _Arg, _Result >

This is one of the functor base classes.

Definition at line 101 of file stl_function.h.

4.995.2 Member Typedef Documentation

4.995.2.1 template<typename _Arg, typename _Result> typedef _Arg std::unary_function< _Arg, _Result >::argument_type

`argument_type` is the type of the argument

Definition at line 104 of file stl_function.h.

4.995.2.2 template<typename _Arg, typename _Result> typedef _Result std::unary_function< _Arg, _Result >::result_type

`result_type` is the return type

Definition at line 107 of file stl_function.h.

The documentation for this struct was generated from the following file:

- stl_function.h

4.996 std::unary_negate< _Predicate > Class Template Reference

Inheritance diagram for std::unary_negate< _Predicate >:

4.999.1 Detailed Description

template<typename _IntType = int>class std::uniform_int_distribution< _IntType >

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.

Definition at line 1666 of file random.h.

4.999.2 Member Typedef Documentation

4.999.2.1 template<typename _IntType = int> typedef _IntType **std::uniform_int_distribution< _IntType >::result_type**

The type of the range of the distribution.

Definition at line 1669 of file random.h.

4.999.3 Constructor & Destructor Documentation

4.999.3.1 template<typename _IntType = int> **std::uniform_int_distribution< _IntType >::uniform_int_distribution (_IntType *__a* = `0`, _IntType *__b* = std::numeric_limits<`_IntType`>`::`max`()`)** `[inline]`, `[explicit]`

Constructs a uniform distribution object.

Definition at line 1709 of file random.h.

4.999.4 Member Function Documentation

4.999.4.1 template<typename _IntType = int> **result_type std::uniform_int_distribution< _IntType >::max ( ) const** `[inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1761 of file random.h.

4.999.4.2 template<typename _IntType = int> result_type std::uniform_int_distribution< _IntType >::min ( ) const [inline]

Returns the inclusive lower bound of the distribution range.

Definition at line 1754 of file random.h.

4.999.4.3 template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type std::uniform_int_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]

Generating functions.

Definition at line 1769 of file random.h.

References std::uniform_int_distribution< _IntType >::operator()().

Referenced by std::uniform_int_distribution< _IntType >::operator()().

4.999.4.4 template<typename _IntType = int> param_type std::uniform_int_distribution< _IntType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 1739 of file random.h.

Referenced by std::operator>>().

4.999.4.5 template<typename _IntType = int> void std::uniform_int_distribution< _IntType >::param (const param_type & __param) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 1747 of file random.h.

4.999.4.6 template<typename _IntType = int> void std::uniform_int_distribution< _IntType >::reset ( ) [inline]

Resets the distribution state.

Does nothing for the uniform integer distribution.

Definition at line 1725 of file random.h.

4.999.5 Friends And Related Function Documentation

4.999.5.1 template<typename _IntType = int> bool operator== (const uniform_int_distribution< _IntType > & __d1, const uniform_int_distribution< _IntType > & __d2) [friend]

Return true if two uniform integer distributions have the same parameters.

Definition at line 1804 of file random.h.

The documentation for this class was generated from the following files:

4.1001.1 Detailed Description

template<typename _RealType = double>class std::uniform_real_distribution< _RealType >

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Definition at line 1867 of file random.h.

4.1001.2 Member Typedef Documentation

4.1001.2.1 template<typename _RealType = double> typedef _RealType std::uniform_real_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 1870 of file random.h.

4.1001.3 Constructor & Destructor Documentation

4.1001.3.1 template<typename _RealType = double> std::uniform_real_distribution< _RealType >::uniform_real_distribution (_RealType *__a* = `_RealType(0)`, _RealType *__b* = `_RealType(1)`) `[inline]`, `[explicit]`

Constructs a uniform_real_distribution object.

Parameters

__a	[IN] The lower bound of the distribution.
__b	[IN] The upper bound of the distribution.

Definition at line 1913 of file random.h.

4.1001.4 Member Function Documentation

4.1001.4.1 template<typename _RealType = double> result_type std::uniform_real_distribution< _RealType >::max ( ) const [inline]

Returns the inclusive upper bound of the distribution range.

Definition at line 1965 of file random.h.

4.1001.4.2 template<typename _RealType = double> result_type std::uniform_real_distribution< _RealType >::min ( ) const [inline]

Returns the inclusive lower bound of the distribution range.

Definition at line 1958 of file random.h.

4.1001.4.3 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::uniform_real_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

  bool **operator==** (const unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 > &, const unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 > &)

4.1006.1 Detailed Description

template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >>class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, and `unordered associative container`

The resulting value type of the container is std::pair<const _Key, _Tp>.

Base is _Hashtable, dispatched at compile time via template alias __umap_hashtable.

Definition at line 97 of file unordered_map.h.

4.1006.3 Constructor & Destructor Documentation

4.1006.3.1 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> > > **std::unordered_map**< _Key, _Tp, _Hash, _Pred, _Alloc >::**unordered_map** (**size_type** *__n* = `10`, const **hasher** & *__hf* = **hasher** `()`, const **key_equal** & *__eql* = **key_equal** `()`, const **allocator_type** & *__a* = **allocator_type** `()`) `[inline]`, `[explicit]`

Default constructor creates no elements.

Parameters

__n	Initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 138 of file unordered_map.h.

4.1006.3.2 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> > > template<typename _InputIterator > **std::unordered_map**< _Key, _Tp, _Hash, _Pred, _Alloc >::**unordered_map** (_InputIterator *__f*, _InputIterator *__l*, **size_type** *__n* = `0`, const **hasher** & *__hf* = **hasher** `()`, const **key_equal** & *__eql* = **key_equal** `()`, const **allocator_type** & *__a* = **allocator_type** `()`) `[inline]`

Builds an unordered_map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_map consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

Definition at line 159 of file unordered_map.h.

4.1006.3.3 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]

Copy constructor.

4.1006.3.4 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &&) [default]

Move constructor.

4.1006.3.5 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (initializer_list< value_type > __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eql = key_equal(), const allocator_type & __a = allocator_type()) [inline]

Builds an unordered_map from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_map consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

Definition at line 184 of file unordered_map.h.

4.1006.4 Member Function Documentation

4.1006.4.1 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (const key_type & __k) [inline]

Access to unordered_map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to *__k*, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

Definition at line 612 of file unordered_map.h.

4.1006.4.2 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (const key_type & __k) const [inline]

Access to unordered_map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to *__k*, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

Definition at line 616 of file unordered_map.h.

4.1006.4.3 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read/write iterator that points to the first element in the unordered_map.

Definition at line 248 of file unordered_map.h.

4.1006.4.4 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_map.

Definition at line 257 of file unordered_map.h.

4.1006.4.5 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (size_type __n) [inline]

Returns a read/write iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read/write local iterator.

Definition at line 657 of file unordered_map.h.

4.1006.4.6 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 668 of file unordered_map.h.

4.1006.4.7 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline], [noexcept]

Returns the number of buckets of the unordered_map.

Definition at line 624 of file unordered_map.h.

4.1006.4.8 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_map.

Definition at line 261 of file unordered_map.h.

4.1006.4.9 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 672 of file unordered_map.h.

4.1006.4.10 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.

Definition at line 283 of file unordered_map.h.

4.1006.4.11 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 698 of file unordered_map.h.

4.1006.4.12 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in an unordered_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 497 of file unordered_map.h.

4.1006.4.13 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::count (const key_type & *__x*) const [inline]

Finds the number of elements.

Parameters

__x	Key to count.

Returns

Number of elements with specified key.

This function only makes sense for unordered_multimap; for unordered_map the result will either be 0 (not present) or 1 (present).

Definition at line 560 of file unordered_map.h.

4.1006.4.14 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (_Args &&... *__args*) [inline]

Attempts to build and insert a std::pair into the unordered_map.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.

Insertion requires amortized constant time.

Definition at line 310 of file unordered_map.h.

4.1006.4.15 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (const_iterator __pos, _Args &&... __args) [inline]

Attempts to build and insert a std::pair into the unordered_map.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args* (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 340 of file unordered_map.h.

4.1006.4.16 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> bool std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the unordered_map is empty.

Definition at line 228 of file unordered_map.h.

4.1006.4.17 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]

Returns a read/write iterator that points one past the last element in the unordered_map.

Definition at line 270 of file unordered_map.h.

4.1006.4.18 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.

Definition at line 279 of file unordered_map.h.

4.1006.4.19 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (size_type __n) [inline]

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read/write local iterator.

Definition at line 683 of file unordered_map.h.

4.1006.4.20 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 694 of file unordered_map.h.

4.1006.4.21 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, iterator> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (const key_type & *__x*) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

Definition at line 573 of file unordered_map.h.

4.1006.4.22 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (const key_type & *__x*) const [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

Definition at line 577 of file unordered_map.h.

4.1006.4.23 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (const_iterator *__position*) [inline]

Erases an element from an unordered_map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 447 of file unordered_map.h.

4.1006.4.24 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (iterator *__it*) [inline]

Erases an element from an unordered_map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 452 of file unordered_map.h.

4.1006.4.25 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (const key_type & *__x*) [inline]

Erases elements according to the provided key.

Parameters

__x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_map. For an unordered_map the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 469 of file unordered_map.h.

4.1006.4.26 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (const_iterator *__first*, const_iterator *__last*) [inline]

Erases a [__first,__last) range of elements from an unordered_map.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_map. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 487 of file unordered_map.h.

4.1006.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (const key_type & *__x*) [inline]

Tries to locate an element in an unordered_map.

Parameters

__x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 542 of file unordered_map.h.

4.1006.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (const key_type & __x) const [inline]

Tries to locate an element in an unordered_map.

Parameters

__x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 546 of file unordered_map.h.

4.1006.4.29 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Returns the allocator object with which the unordered_map was constructed.

Definition at line 221 of file unordered_map.h.

4.1006.4.30 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> hasher std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]

Returns the hash functor object with which the unordered_map was constructed.

Definition at line 518 of file unordered_map.h.

4.1006.4.31 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (const value_type & __x) [inline]

Attempts to insert a std::pair into the unordered_map.

Parameters

__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.

Insertion requires amortized constant time.

Definition at line 362 of file unordered_map.h.

4.1006.4.32 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair , typename = typename std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (_Pair && __x) [inline]

Attempts to insert a std::pair into the unordered_map.

Parameters

__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.

Insertion requires amortized constant time.

Definition at line 369 of file unordered_map.h.

4.1006.4.33 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (const_iterator *__hint*, const value_type & *__x*) [inline]

Attempts to insert a std::pair into the unordered_map.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 396 of file unordered_map.h.

4.1006.4.34 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair , typename = typename std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (const_iterator __*hint*, _Pair && __*x*) [inline]

Attempts to insert a std::pair into the unordered_map.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 403 of file unordered_map.h.

4.1006.4.35 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (_InputIterator __*first*, _InputIterator __*last*) [inline]

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 418 of file unordered_map.h.

4.1006.4.36 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (initializer_list< value_type > __*l*) [inline]

Attempts to insert a list of elements into the unordered_map.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 429 of file unordered_map.h.

4.1006.4.37 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> key_equal std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]

Returns the key comparison object with which the unordered_map was constructed.

Definition at line 524 of file unordered_map.h.

4.1006.4.38 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline], [noexcept]

Returns the average number of elements per bucket.

Definition at line 706 of file unordered_map.h.

4.1006.4.39 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline], [noexcept]

Returns the maximum number of buckets of the unordered_map.

Definition at line 629 of file unordered_map.h.

4.1006.4.40 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline], [noexcept]

Returns a positive number that the unordered_map tries to keep the load factor less than or equal to.

Definition at line 712 of file unordered_map.h.

4.1006.4.41 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (float *__z*) [inline]

Change the unordered_map maximum load factor.

Parameters

__z	The new maximum load factor.

Definition at line 720 of file unordered_map.h.

4.1006.4.42 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the unordered_map.

Definition at line 238 of file unordered_map.h.

4.1006.4.43 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]

Copy assignment operator.

4.1006.4.44 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &&) [default]

Move assignment operator.

4.1006.4.45 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (initializer_list< value_type > __l) [inline]

Unordered_map list assignment operator.

Parameters

__l	An initializer_list.

This function fills an unordered_map with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the unordered_map and that the resulting unordered_map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 212 of file unordered_map.h.

4.1006.4.46 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (const key_type & __k) [inline]

Subscript ([]) access to unordered_map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([])operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 595 of file unordered_map.h.

4.1006.4.47 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (key_type && __k) [inline]

Subscript ([]) access to unordered_map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([])operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 599 of file unordered_map.h.

4.1006.4.48 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (size_type __n) [inline]

May rehash the unordered_map.

Parameters

__n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_map maximum load factor.

Definition at line 731 of file unordered_map.h.

4.1006.4.49 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (size_type __n) [inline]

Prepare the unordered_map for a specified number of elements.

Parameters

__n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).

Definition at line 742 of file unordered_map.h.

4.1006.4.50 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the unordered_map.

Definition at line 233 of file unordered_map.h.

4.1006.4.51 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline]

Swaps data with another unordered_map.

Parameters

__x	An unordered_map of the same element and allocator types.

This exchanges the elements between two unordered_map in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

Definition at line 510 of file unordered_map.h.

4.1007.1 Detailed Description

template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >>class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, and `unordered associative container`

The resulting value type of the container is std::pair<const _Key, _Tp>.

Base is _Hashtable, dispatched at compile time via template alias __ummap_hashtable.

Definition at line 778 of file unordered_map.h.

4.1007.3 Constructor & Destructor Documentation

4.1007.3.1 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (size_type *__n* = 10, const hasher & *__hf* = hasher(), const key_equal & *__eql* = key_equal(), const allocator_type & *__a* = allocator_type()) [inline], [explicit]

Default constructor creates no elements.

Parameters

__n	Initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 819 of file unordered_map.h.

4.1007.3.2 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (_InputIterator *__f*, _InputIterator *__l*, size_type *__n* = 0, const hasher & *__hf* = hasher(), const key_equal & *__eql* = key_equal(), const allocator_type & *__a* = allocator_type()) [inline]

Builds an unordered_multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multimap consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

Definition at line 840 of file unordered_map.h.

4.1007.3.3 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]

Copy constructor.

4.1007.3.4 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &&) [default]

Move constructor.

4.1007.3.5 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (initializer_list< value_type > __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eql = key_equal(), const allocator_type & __a = allocator_type()) [inline]

Builds an unordered_multimap from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multimap consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

Definition at line 865 of file unordered_map.h.

4.1007.4 Member Function Documentation

4.1007.4.1 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read/write iterator that points to the first element in the unordered_multimap.

Definition at line 929 of file unordered_map.h.

4.1007.4.2 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

Definition at line 938 of file unordered_map.h.

4.1007.4.3 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (size_type __n) [inline]

Returns a read/write iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read/write local iterator.

Definition at line 1277 of file unordered_map.h.

4.1007.4.4 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1288 of file unordered_map.h.

4.1007.4.5 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline], [noexcept]

Returns the number of buckets of the unordered_multimap.

Definition at line 1244 of file unordered_map.h.

4.1007.4.6 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

Definition at line 942 of file unordered_map.h.

4.1007.4.7 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1292 of file unordered_map.h.

4.1007.4.8 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

Definition at line 964 of file unordered_map.h.

4.1007.4.9 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1318 of file unordered_map.h.

4.1007.4.10 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in an unordered_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1161 of file unordered_map.h.

4.1007.4.11 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::count (const key_type & __x) const [inline]

Finds the number of elements.

Parameters

__x	Key to count.

Returns

Number of elements with specified key.

Definition at line 1221 of file unordered_map.h.

4.1007.4.12 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (_Args &&... __args) [inline]

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered_multimap.

Insertion requires amortized constant time.

Definition at line 987 of file unordered_map.h.

4.1007.4.13 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (const_iterator __pos, _Args &&... __args) [inline]

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args*.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1013 of file unordered_map.h.

4.1007.4.14 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the unordered_multimap is empty.

Definition at line 909 of file unordered_map.h.

4.1007.4.15 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]

Returns a read/write iterator that points one past the last element in the unordered_multimap.

Definition at line 951 of file unordered_map.h.

4.1007.4.16 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

Definition at line 960 of file unordered_map.h.

4.1007.4.17 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (size_type __n) [inline]

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read/write local iterator.

Definition at line 1303 of file unordered_map.h.

4.1007.4.18 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1314 of file unordered_map.h.

4.1007.4.19 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, iterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (const key_type & __x) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1232 of file unordered_map.h.

4.1007.4.20 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (const key_type & *__x*) const `[inline]`

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1236 of file unordered_map.h.

4.1007.4.21 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (const_iterator *__position*) `[inline]`

Erases an element from an unordered_multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1111 of file unordered_map.h.

4.1007.4.22 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (iterator *__it*) `[inline]`

Erases an element from an unordered_multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1116 of file unordered_map.h.

4.1007.4.23 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (const key_type & *__x*) `[inline]`

Erases elements according to the provided key.

Parameters

__x	Key of elements to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1132 of file unordered_map.h.

4.1007.4.24 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (const_iterator *__first*, const_iterator *__last*) `[inline]`

Erases a [__first,__last) range of elements from an unordered_multimap.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_multimap. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1151 of file unordered_map.h.

4.1007.4.25 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (const key_type & __x) [inline]

Tries to locate an element in an unordered_multimap.

Parameters

__x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1207 of file unordered_map.h.

4.1007.4.26 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (const key_type & __x) const [inline]

Tries to locate an element in an unordered_multimap.

Parameters

__x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1211 of file unordered_map.h.

4.1007.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Returns the allocator object with which the unordered_multimap was constructed.

Definition at line 902 of file unordered_map.h.

4.1007.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]

Returns the hash functor object with which the unordered_multimap was constructed.

Definition at line 1183 of file unordered_map.h.

4.1007.4.29 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (const value_type & __x) [inline]

Inserts a std::pair into the unordered_multimap.

Parameters

__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1027 of file unordered_map.h.

4.1007.4.30 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair , typename = typename std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (_Pair && __x) [inline]

Inserts a std::pair into the unordered_multimap.

Parameters

__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1034 of file unordered_map.h.

4.1007.4.31 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (const_iterator __hint, const value_type & __x) [inline]

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1059 of file unordered_map.h.

4.1007.4.32 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair , typename = typename std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (const_iterator *__hint,* _Pair && *__x*) `[inline]`

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html` for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1066 of file unordered_map.h.

4.1007.4.33 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (_InputIterator *__first,* _InputIterator *__last*) `[inline]`

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 1081 of file unordered_map.h.

4.1007.4.34 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (initializer_list< value_type > *__l*) `[inline]`

Attempts to insert a list of elements into the unordered_multimap.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 1093 of file unordered_map.h.

4.1007.4.35 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]

Returns the key comparison object with which the unordered_multimap was constructed.

Definition at line 1189 of file unordered_map.h.

4.1007.4.36 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline], [noexcept]

Returns the average number of elements per bucket.

Definition at line 1326 of file unordered_map.h.

4.1007.4.37 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline], [noexcept]

Returns the maximum number of buckets of the unordered_multimap.

Definition at line 1249 of file unordered_map.h.

4.1007.4.38 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline], [noexcept]

Returns a positive number that the unordered_multimap tries to keep the load factor less than or equal to.

Definition at line 1332 of file unordered_map.h.

4.1007.4.39 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (float __z) [inline]

Change the unordered_multimap maximum load factor.

Parameters

__z	The new maximum load factor.

Definition at line 1340 of file unordered_map.h.

4.1007.4.40 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the unordered_multimap.

Definition at line 919 of file unordered_map.h.

4.1007.4.41 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &) `[default]`

Copy assignment operator.

4.1007.4.42 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &&) `[default]`

Move assignment operator.

4.1007.4.43 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (initializer_list< value_type > *__l*) `[inline]`

Unordered_multimap list assignment operator.

Parameters

__l	An initializer_list.

This function fills an unordered_multimap with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the unordered_multimap and that the resulting unordered_multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 893 of file unordered_map.h.

4.1007.4.44 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (size_type *__n*) `[inline]`

May rehash the unordered_multimap.

Parameters

__n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_multimap maximum load factor.

Definition at line 1351 of file unordered_map.h.

4.1007.4.45 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (size_type *__n*) `[inline]`

Prepare the unordered_multimap for a specified number of elements.

Parameters

__n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).

Definition at line 1362 of file unordered_map.h.

4.1007.4.46 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the unordered_multimap.

Definition at line 914 of file unordered_map.h.

4.1007.4.47 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline]

Swaps data with another unordered_multimap.

Parameters

__x	An unordered_multimap of the same element and allocator types.

This exchanges the elements between two unordered_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

Definition at line 1175 of file unordered_map.h.

4.1008.1 Detailed Description

template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Template Parameters

_Value	Type of key objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, and `unordered associative container`

Base is _Hashtable, dispatched at compile time via template alias __umset_hashtable.

Definition at line 698 of file unordered_set.h.

4.1008.3 Constructor & Destructor Documentation

4.1008.3.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> **std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (size_type** *__n* = `10`, const **hasher** & *__hf* = **hasher** `()`, const **key_equal** & *__eql* = **key_equal** `()`, const **allocator_type** & *__a* = **allocator_type** `()` **)** `[inline], [explicit]`

Default constructor creates no elements.

Parameters

__n	Initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 737 of file unordered_set.h.

4.1008.3.2 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename _InputIterator > **std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (** _InputIterator *__f*, _InputIterator *__l*, **size_type** *__n* = `0`, const **hasher** & *__hf* = **hasher** `()`, const **key_equal** & *__eql* = **key_equal** `()`, const **allocator_type** & *__a* = **allocator_type** `()` **)** `[inline]`

Builds an unordered_multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multiset consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

Definition at line 758 of file unordered_set.h.

4.1008.3.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> **std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (** const **unordered_multiset**< _Value, _Hash, _Pred, _Alloc > & **)** `[default]`

Copy constructor.

4.1008.3.4 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (unordered_multiset< _Value, _Hash, _Pred, _Alloc > &&) [default]

Move constructor.

4.1008.3.5 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (initializer_list< value_type > __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eql = key_equal(), const allocator_type & __a = allocator_type()) [inline]

Builds an unordered_multiset from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multiset consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

Definition at line 783 of file unordered_set.h.

4.1008.4 Member Function Documentation

4.1008.4.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 848 of file unordered_set.h.

4.1008.4.2 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 852 of file unordered_set.h.

4.1008.4.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (size_type __n) [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1175 of file unordered_set.h.

4.1008.4.4 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1179 of file unordered_set.h.

4.1008.4.5 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline], [noexcept]

Returns the number of buckets of the unordered_multiset.

Definition at line 1141 of file unordered_set.h.

4.1008.4.6 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 875 of file unordered_set.h.

4.1008.4.7 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1183 of file unordered_set.h.

4.1008.4.8 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 883 of file unordered_set.h.

4.1008.4.9 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (size_type __n) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1203 of file unordered_set.h.

4.1008.4.10 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in an unordered_multiset.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1059 of file unordered_set.h.

4.1008.4.11 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (const key_type & __x) const [inline]

Finds the number of elements.

Parameters

__x	Element to located.

Returns

Number of elements with specified key.

Definition at line 1118 of file unordered_set.h.

4.1008.4.12 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (_Args &&... __args) [inline]

Builds and insert an element into the unordered_multiset.

Parameters

__args	Arguments used to generate an element.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 897 of file unordered_set.h.

4.1008.4.13 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (const_iterator __pos, _Args &&... __args) [inline]

Inserts an element into the unordered_multiset.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html

Insertion requires amortized constant time.

Definition at line 919 of file unordered_set.h.

4.1008.4.14 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the unordered_multiset is empty.

Definition at line 827 of file unordered_set.h.

4.1008.4.15 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 862 of file unordered_set.h.

4.1008.4.16 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 866 of file unordered_set.h.

4.1008.4.17 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (size_type *__n*) [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1195 of file unordered_set.h.

4.1008.4.18 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1199 of file unordered_set.h.

4.1008.4.19 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (const key_type & *__x*) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1129 of file unordered_set.h.

4.1008.4.20 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (const key_type & __x) const [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1133 of file unordered_set.h.

4.1008.4.21 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (const_iterator __position) [inline]

Erases an element from an unordered_multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1005 of file unordered_set.h.

4.1008.4.22 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (iterator __it) [inline]

Erases an element from an unordered_multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1010 of file unordered_set.h.

4.1008.4.23 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (const key_type & *__x*) [inline]

Erases elements according to the provided key.

Parameters

__x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1028 of file unordered_set.h.

4.1008.4.24 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (const_iterator *__first*, const_iterator *__last*) [inline]

Erases a [__first,__last) range of elements from an unordered_multiset.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1048 of file unordered_set.h.

4.1008.4.25 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (const key_type & *__x*) [inline]

Tries to locate an element in an unordered_multiset.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1104 of file unordered_set.h.

4.1008.4.26 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (const key_type & __x) const [inline]

Tries to locate an element in an unordered_multiset.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1108 of file unordered_set.h.

4.1008.4.27 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Returns the allocator object with which the unordered_multiset was constructed.

Definition at line 820 of file unordered_set.h.

4.1008.4.28 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]

Returns the hash functor object with which the unordered_multiset was constructed.

Definition at line 1080 of file unordered_set.h.

4.1008.4.29 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (const value_type & __x) [inline]

Inserts an element into the unordered_multiset.

Parameters

__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 931 of file unordered_set.h.

4.1008.4.30 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (value_type && __x) [inline]

Inserts an element into the unordered_multiset.

Parameters

__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 935 of file unordered_set.h.

4.1008.4.31 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (const_iterator __hint, const value_type & __x) [inline]

Inserts an element into the unordered_multiset.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html

Insertion requires amortized constant.

Definition at line 957 of file unordered_set.h.

4.1008.4.32 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (const_iterator __hint, value_type && __x) [inline]

Inserts an element into the unordered_multiset.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html`

Insertion requires amortized constant.

Definition at line 961 of file unordered_set.h.

4.1008.4.33 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename _InputIterator > void **std::unordered_multiset**< _Value, _Hash, _Pred, _Alloc >::insert (_InputIterator *__first,* _InputIterator *__last*) `[inline]`

A template function that inserts a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 975 of file unordered_set.h.

4.1008.4.34 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void **std::unordered_multiset**< _Value, _Hash, _Pred, _Alloc >::insert (**initializer_list**< **value_type** > *__l*) `[inline]`

Inserts a list of elements into the unordered_multiset.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 986 of file unordered_set.h.

4.1008.4.35 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> **key_equal std::unordered_multiset**< _Value, _Hash, _Pred, _Alloc >::key_eq ( ) const `[inline]`

Returns the key comparison object with which the unordered_multiset was constructed.

Definition at line 1086 of file unordered_set.h.

4.1008.4.36 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline], [noexcept]

Returns the average number of elements per bucket.

Definition at line 1211 of file unordered_set.h.

4.1008.4.37 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline], [noexcept]

Returns the maximum number of buckets of the unordered_multiset.

Definition at line 1146 of file unordered_set.h.

4.1008.4.38 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline], [noexcept]

Returns a positive number that the unordered_multiset tries to keep the load factor less than or equal to.

Definition at line 1217 of file unordered_set.h.

4.1008.4.39 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (float __z) [inline]

Change the unordered_multiset maximum load factor.

Parameters

__z	The new maximum load factor.

Definition at line 1225 of file unordered_set.h.

4.1008.4.40 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the unordered_multiset.

Definition at line 837 of file unordered_set.h.

4.1008.4.41 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (const unordered_multiset< _Value, _Hash, _Pred, _Alloc > &) [default]

Copy assignment operator.

4.1008.4.42 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (unordered_multiset< _Value, _Hash, _Pred, _Alloc > && __x) [default]

Move assignment operator.

4.1008.4.43 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (initializer_list< value_type > __l) [inline]

Unordered_multiset list assignment operator.

Parameters

__l	An initializer_list.

This function fills an unordered_multiset with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the unordered_multiset and that the resulting unordered_set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 811 of file unordered_set.h.

4.1008.4.44 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (size_type __n) [inline]

May rehash the unordered_multiset.

Parameters

__n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_multiset maximum load factor.

Definition at line 1236 of file unordered_set.h.

4.1008.4.45 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve (size_type __n) [inline]

Prepare the unordered_multiset for a specified number of elements.

Parameters

__n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).

Definition at line 1247 of file unordered_set.h.

4.1008.4.46 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the unordered_multiset.

Definition at line 832 of file unordered_set.h.

4.1008.4.47 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::swap (unordered_multiset< _Value, _Hash, _Pred, _Alloc > & __x) [inline]

Swaps data with another unordered_multiset.

Parameters

__x	An unordered_multiset of the same element and allocator types.

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

Definition at line 1072 of file unordered_set.h.

4.1009.1 Detailed Description

template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>>class std::unordered_set< _Value, _Hash, _Pred, _Alloc >

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Template Parameters

_Value	Type of key objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, and `unordered associative container`

Base is _Hashtable, dispatched at compile time via template alias __uset_hashtable.

Definition at line 93 of file unordered_set.h.

4.1009.2 Member Typedef Documentation

4.1009.3 Constructor & Destructor Documentation

4.1009.3.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> **std::unordered_set**< _Value, _Hash, _Pred, _Alloc >**::unordered_set** (**size_type** *__n* = `10`, const **hasher** & *__hf* = **hasher** `()`, const **key_equal** & *__eql* = **key_equal** `()`, const **allocator_type** & *__a* = **allocator_type** `()`) `[inline]`, `[explicit]`

Default constructor creates no elements.

Parameters

__n	Initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 132 of file unordered_set.h.

4.1009.3.2 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename _InputIterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (_InputIterator *__f*, _InputIterator *__l*, size_type *__n* = `0`, const hasher & *__hf* = hasher `()`, const key_equal & *__eql* = key_equal `()`, const allocator_type & *__a* = allocator_type `()`) `[inline]`

Builds an unordered_set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_set consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

Definition at line 153 of file unordered_set.h.

4.1009.3.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (const unordered_set< _Value, _Hash, _Pred, _Alloc > &) `[default]`

Copy constructor.

4.1009.3.4 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (unordered_set< _Value, _Hash, _Pred, _Alloc > &&) `[default]`

Move constructor.

4.1009.3.5 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (initializer_list< value_type > *__l*, size_type *__n* = `0`, const hasher & *__hf* = hasher `()`, const key_equal & *__eql* = key_equal `()`, const allocator_type & *__a* = allocator_type `()`) `[inline]`

Builds an unordered_set from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_set consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

Definition at line 178 of file unordered_set.h.

4.1009.4 Member Function Documentation

4.1009.4.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

Definition at line 243 of file unordered_set.h.

4.1009.4.2 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

Definition at line 247 of file unordered_set.h.

4.1009.4.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (size_type *__n*) [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 593 of file unordered_set.h.

4.1009.4.4 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 597 of file unordered_set.h.

4.1009.4.5 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline], [noexcept]

Returns the number of buckets of the unordered_set.

Definition at line 559 of file unordered_set.h.

4.1009.4.6 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

Definition at line 270 of file unordered_set.h.

4.1009.4.7 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 601 of file unordered_set.h.

4.1009.4.8 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

Definition at line 278 of file unordered_set.h.

4.1009.4.9 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 621 of file unordered_set.h.

4.1009.4.10 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in an unordered_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 471 of file unordered_set.h.

4.1009.4.11 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (const key_type & __x) const [inline]

Finds the number of elements.

Parameters

__x	Element to located.

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).

Definition at line 534 of file unordered_set.h.

4.1009.4.12 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename... _Args> std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (_Args &&... __args) [inline]

Attempts to build and insert an element into the unordered_set.

Parameters

__args	Arguments used to generate an element.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

Definition at line 300 of file unordered_set.h.

4.1009.4.13 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename... _Args> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (const_iterator *__pos*, _Args &&... *__args*) [inline]

Attempts to insert an element into the unordered_set.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

> An iterator that points to the element with key equivalent to the one generated from *__args* (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html

Insertion requires amortized constant time.

Definition at line 326 of file unordered_set.h.

4.1009.4.14 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the unordered_set is empty.

Definition at line 222 of file unordered_set.h.

4.1009.4.15 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

Definition at line 257 of file unordered_set.h.

4.1009.4.16 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

Definition at line 261 of file unordered_set.h.

4.1009.4.17 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (size_type *__n*) [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 613 of file unordered_set.h.

4.1009.4.18 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (size_type *__n*) const [inline]

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 617 of file unordered_set.h.

4.1009.4.19 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range (const key_type & *__x*) [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 547 of file unordered_set.h.

4.1009.4.20 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range (const key_type & *__x*) const [inline]

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 551 of file unordered_set.h.

4.1009.4.21 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (const_iterator *__position*) [inline]

Erases an element from an unordered_set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 421 of file unordered_set.h.

4.1009.4.22 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (iterator *__it*) [inline]

Erases an element from an unordered_set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 426 of file unordered_set.h.

4.1009.4.23 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (const key_type & *__x*) [inline]

Erases elements according to the provided key.

Parameters

__x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_set. For an unordered_set the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 443 of file unordered_set.h.

4.1009.4.24 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (const_iterator *__first,* const_iterator *__last*) [inline]

Erases a [__first,__last) range of elements from an unordered_set.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 461 of file unordered_set.h.

4.1009.4.25 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (const key_type & *__x*) [inline]

Tries to locate an element in an unordered_set.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 516 of file unordered_set.h.

4.1009.4.26 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (const key_type & __x) const [inline]

Tries to locate an element in an unordered_set.

Parameters

__x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 520 of file unordered_set.h.

4.1009.4.27 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Returns the allocator object with which the unordered_set was constructed.

Definition at line 215 of file unordered_set.h.

4.1009.4.28 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]

Returns the hash functor object with which the unordered_set was constructed.

Definition at line 492 of file unordered_set.h.

4.1009.4.29 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (const value_type & __x) [inline]

Attempts to insert an element into the unordered_set.

Parameters

__x	Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

Definition at line 344 of file unordered_set.h.

4.1009.4.30 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (value_type && __x) [inline]

Attempts to insert an element into the unordered_set.

Parameters

__x	Element to be inserted.

Returns

> A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

Definition at line 348 of file unordered_set.h.

4.1009.4.31 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (const_iterator __hint, const value_type & __x) [inline]

Attempts to insert an element into the unordered_set.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html`

Insertion requires amortized constant.

Definition at line 373 of file unordered_set.h.

4.1009.4.32 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (const_iterator *__hint,* value_type && *__x*) `[inline]`

Attempts to insert an element into the unordered_set.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html`

Insertion requires amortized constant.

Definition at line 377 of file unordered_set.h.

4.1009.4.33 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename _InputIterator > void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (_InputIterator *__first,* _InputIterator *__last*) `[inline]`

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 392 of file unordered_set.h.

4.1009.4.34 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void **std::unordered_set**< _Value, _Hash, _Pred, _Alloc >::insert (**initializer_list**< **value_type** > *__l*) [inline]

Attempts to insert a list of elements into the unordered_set.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 403 of file unordered_set.h.

4.1009.4.35 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> **key_equal std::unordered_set**< _Value, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]

Returns the key comparison object with which the unordered_set was constructed.

Definition at line 498 of file unordered_set.h.

4.1009.4.36 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> float **std::unordered_set**< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline], [noexcept]

Returns the average number of elements per bucket.

Definition at line 629 of file unordered_set.h.

4.1009.4.37 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> **size_type std::unordered_set**< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline], [noexcept]

Returns the maximum number of buckets of the unordered_set.

Definition at line 564 of file unordered_set.h.

4.1009.4.38 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> float **std::unordered_set**< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline], [noexcept]

Returns a positive number that the unordered_set tries to keep the load factor less than or equal to.

Definition at line 635 of file unordered_set.h.

4.1009.4.39 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void **std::unordered_set**< _Value, _Hash, _Pred, _Alloc >::max_load_factor (float *__z*) [inline]

Change the unordered_set maximum load factor.

Parameters

__z	The new maximum load factor.

Definition at line 643 of file unordered_set.h.

4.1009.4.40 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const `[inline]`, `[noexcept]`

Returns the maximum size of the unordered_set.

Definition at line 232 of file unordered_set.h.

4.1009.4.41 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (const unordered_set< _Value, _Hash, _Pred, _Alloc > &) `[default]`

Copy assignment operator.

4.1009.4.42 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (unordered_set< _Value, _Hash, _Pred, _Alloc > &&) `[default]`

Move assignment operator.

4.1009.4.43 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (initializer_list< value_type > __l) `[inline]`

Unordered_set list assignment operator.

Parameters

__l	An initializer_list.

This function fills an unordered_set with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the unordered_set and that the resulting unordered_set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 206 of file unordered_set.h.

4.1009.4.44 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (size_type *__n*) `[inline]`

May rehash the unordered_set.

Parameters

__n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_set maximum load factor.

Definition at line 654 of file unordered_set.h.

4.1009.4.45 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (size_type *__n*) `[inline]`

Prepare the unordered_set for a specified number of elements.

Parameters

__n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).

Definition at line 665 of file unordered_set.h.

4.1009.4.46 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the unordered_set.

Definition at line 227 of file unordered_set.h.

4.1009.4.47 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (unordered_set< _Value, _Hash, _Pred, _Alloc > & __x) [inline]

Swaps data with another unordered_set.

Parameters

__x	An unordered_set of the same element and allocator types.

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

Definition at line 484 of file unordered_set.h.

4.1012.1 Detailed Description

template<class _Tp>class std::valarray< _Tp >

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

Template Parameters

_Tp	Type of object in the array.

Definition at line 116 of file valarray.

4.1012.2 Constructor & Destructor Documentation

4.1012.2.1 template<class _Tp> std::valarray< _Tp >::valarray (const _Tp * *__restrict__*, size_t)

Construct an array initialized to the first *n* elements of *t*.

The documentation for this class was generated from the following file:

- valarray

4.1013.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>class std::vector< _Tp, _Alloc >

A standard container which offers fixed time access to individual elements in any order.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `reversible container`, and a `sequence`, including the `optional sequence requirements` with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ([]) access is also provided as with C-style arrays.

Definition at line 210 of file stl_vector.h.

4.1013.2 Constructor & Destructor Documentation

4.1013.2.1 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( ) `[inline]`

Default constructor creates no elements.

Definition at line 248 of file stl_vector.h.

4.1013.2.2 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (const allocator_type & *__a*) `[inline]`, `[explicit]`

Creates a vector with no elements.

Parameters

__a	An allocator object.

Definition at line 256 of file stl_vector.h.

4.1013.2.3 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (size_type __n, const allocator_type & __a = `allocator_type()`) `[inline]`, `[explicit]`

Creates a vector with default constructed elements.

Parameters

__n	The number of elements to initially create.
__a	An allocator.

This constructor fills the vector with *__n* default constructed elements.

Definition at line 269 of file stl_vector.h.

4.1013.2.4 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (size_type __n, const value_type & __value, const allocator_type & __a = `allocator_type()`) `[inline]`

Creates a vector with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator.

This constructor fills the vector with *__n* copies of *__value*.

Definition at line 281 of file stl_vector.h.

4.1013.2.5 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (const vector< _Tp, _Alloc > & __x) `[inline]`

Vector copy constructor.

Parameters

__x	A vector of identical element and allocator types.

The newly-created vector uses a copy of the allocation object used by *__x*. All the elements of *__x* are copied, but any extra memory in *__x* (for fast expansion) will not be copied.

Definition at line 310 of file stl_vector.h.

4.1013.2.6 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (vector< _Tp, _Alloc > && __x) `[inline]`, `[noexcept]`

Vector move constructor.

Parameters

__x	A vector of identical element and allocator types.

The newly-created vector contains the exact contents of *__x*. The contents of *__x* are a valid, but unspecified vector.

Definition at line 327 of file stl_vector.h.

4.1013.2.7 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (const vector< _Tp, _Alloc > & *__x*, const allocator_type & *__a*) `[inline]`

Copy constructor with alternative allocator.

Definition at line 331 of file stl_vector.h.

4.1013.2.8 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (vector< _Tp, _Alloc > && *__rv*, const allocator_type & *__m*) `[inline]`

Move constructor with alternative allocator.

Definition at line 340 of file stl_vector.h.

4.1013.2.9 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (initializer_list< value_type > *__l*, const allocator_type & *__a* = `allocator_type()`) `[inline]`

Builds a vector from an initializer list.

Parameters

__l	An initializer_list.
__a	An allocator.

Create a vector consisting of copies of the elements in the initializer_list *__l*.

This will call the element type's copy constructor N times (where N is *__l.size()*) and do no memory reallocation.

Definition at line 364 of file stl_vector.h.

4.1013.2.10 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> std::vector< _Tp, _Alloc >::vector (_InputIterator *__first*, _InputIterator *__last*, const allocator_type & *__a* = `allocator_type()`) `[inline]`

Builds a vector from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__a	An allocator.

Create a vector consisting of copies of the elements from [first,last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

Definition at line 392 of file stl_vector.h.

4.1013.2.11 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::∼vector ( ) `[inline]`, `[noexcept]`

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 414 of file stl_vector.h.

4.1013.3 Member Function Documentation

4.1013.3.1 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _ForwardIterator > pointer std::vector< _Tp, _Alloc >::_M_allocate_and_copy (size_type __n, _ForwardIterator __first, _ForwardIterator __last) [inline], [protected]

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

Definition at line 1135 of file stl_vector.h.

4.1013.3.2 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::_M_range_check (size_type __n) const [inline], [protected]

Safety check used only from at().

Definition at line 791 of file stl_vector.h.

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::at().

4.1013.3.3 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::assign (size_type __n, const value_type & __val) [inline]

Assigns a given value to a vector.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a vector with *__n* copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 479 of file stl_vector.h.

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::operator=().

4.1013.3.4 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void std::vector< _Tp, _Alloc >::assign (_InputIterator __first, _InputIterator __last) [inline]

Assigns a range to a vector.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a vector with copies of the elements in the range [__first,__last).

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 498 of file stl_vector.h.

4.1013.3.5 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::assign (initializer_list< value_type > __l) [inline]

Assigns an initializer list to a vector.

Parameters

__l	An initializer_list.

This function fills a vector with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 524 of file stl_vector.h.

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::assign().

4.1013.3.6 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::at (size_type *__n*) [inline]

Provides access to the data contained in the vector.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

Exceptions

std::out_of_range	If *__n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws out_of_range if the check fails.

Definition at line 810 of file stl_vector.h.

4.1013.3.7 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc >::at (size_type *__n*) const [inline]

Provides access to the data contained in the vector.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

Exceptions

std::out_of_range	If *__n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws out_of_range if the check fails.

Definition at line 828 of file stl_vector.h.

4.1013.3.8 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::back ( ) [inline]

Returns a read/write reference to the data at the last element of the vector.

Definition at line 855 of file stl_vector.h.

Referenced by std::piecewise_constant_distribution< _RealType >::max(), and std::piecewise_linear_distribution< _RealType >::max().

4.1013.3.9 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc >::back ( ) const [inline]

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 863 of file stl_vector.h.

4.1013.3.10 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 538 of file stl_vector.h.

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::crend(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::empty(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::front(), __gnu_parallel::multiseq_partition(), __gnu_parallel::multiseq_selection(), __gnu_parallel::multiway_merge_exact_splitting(), std::operator<(), std::vector< _Tp, _Alloc >::operator=(), std::operator==(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::rend(), and std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::vector().

4.1013.3.11 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 547 of file stl_vector.h.

4.1013.3.12 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::capacity ( ) const [inline], [noexcept]

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 725 of file stl_vector.h.

4.1013.3.13 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 611 of file stl_vector.h.

4.1013.3.14 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 620 of file stl_vector.h.

4.1013.3.15 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::clear ( ) [inline], [noexcept]

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1125 of file stl_vector.h.

4.1013.3.16 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector< _Tp, _Alloc >::crbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 629 of file stl_vector.h.

4.1013.3.17 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector< _Tp, _Alloc >::crend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 638 of file stl_vector.h.

4.1013.3.18 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> _Tp* std::vector< _Tp, _Alloc >::data ( ) [inline], [noexcept]

Returns a pointer such that [data(), data() + size()) is a valid range. For a non-empty vector, data() == &front().

Definition at line 878 of file stl_vector.h.

4.1013.3.19 template<typename _Tp , typename _Alloc > template<typename... _Args> vector< _Tp, _Alloc >::iterator vector::emplace (iterator *__position*, _Args &&... *__args*)

Inserts an object in vector before specified iterator.

Parameters

__position	An iterator into the vector.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

Definition at line 292 of file vector.tcc.

References std::begin(), and std::end().

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::insert().

4.1013.3.20 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::vector< _Tp, _Alloc >::empty ( ) const [inline], [noexcept]

Returns true if the vector is empty. (Thus begin() would equal end().)

Definition at line 734 of file stl_vector.h.

Referenced by std::piecewise_constant_distribution< _RealType >::densities(), std::piecewise_linear_distribution< _RealType >::densities(), std::piecewise_constant_distribution< _RealType >::intervals(), std::piecewise_linear_distribution< _RealType >::intervals(), std::discrete_distribution< _IntType >::max(), std::piecewise_constant_distribution< _RealType >::max(), std::piecewise_linear_distribution< _RealType >::max(), std::piecewise_constant_distribution< _RealType >::min(), std::piecewise_linear_distribution< _RealType >::min(), and std::discrete_distribution< _IntType >::probabilities().

4.1013.3.21 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator **std::vector**< _Tp, _Alloc >::end ( ) `[inline]`, `[noexcept]`

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 556 of file stl_vector.h.

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::back(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::crbegin(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::empty(), __gnu_parallel::multiseq_partition(), __gnu_parallel::multiseq_selection(), __gnu_parallel::multiway_merge_exact_splitting(), std::operator<(), std::vector< _Tp, _Alloc >::operator=(), std::operator==(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::push_back(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::rbegin(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::resize(), and std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::vector().

4.1013.3.22 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator **std::vector**< _Tp, _Alloc >::end ( ) const `[inline]`, `[noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 565 of file stl_vector.h.

4.1013.3.23 template<typename _Tp , typename _Alloc > **vector**< _Tp, _Alloc >::iterator vector::erase (iterator *__position*)

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using std::list. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 135 of file vector.tcc.

References std::end().

4.1013.3.24 template<typename _Tp , typename _Alloc > **vector**< _Tp, _Alloc >::iterator vector::erase (iterator *__first*, iterator *__last*)

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *__last* prior to erasing (or end()).

This function will erase the elements in the range [__first,__last) and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using std::list. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 147 of file vector.tcc.

References std::end().

4.1013.3.25 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::front ( ) `[inline]`

Returns a read/write reference to the data at the first element of the vector.

Definition at line 839 of file stl_vector.h.

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::data(), std::piecewise_constant_distribution< _RealType >::min(), and std::piecewise_linear_distribution< _RealType >::min().

4.1013.3.26 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc >::front ( ) const `[inline]`

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 847 of file stl_vector.h.

4.1013.3.27 template<typename _Tp , typename _Alloc > vector< _Tp, _Alloc >::iterator vector::insert (iterator *__position,* const value_type & *__x*)

Inserts given value into vector before specified iterator.

Parameters

__position	An iterator into the vector.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

Definition at line 108 of file vector.tcc.

References std::begin(), and std::end().

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::resize().

4.1013.3.28 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::insert (iterator *__position*, value_type && *__x*) [inline]

Inserts given rvalue into vector before specified iterator.

Parameters

__position	An iterator into the vector.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

Definition at line 988 of file stl_vector.h.

4.1013.3.29 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::insert (iterator *__position*, initializer_list< value_type > *__l*) [inline]

Inserts an initializer_list into the vector.

Parameters

__position	An iterator into the vector.
__l	An initializer_list.

This function will insert copies of the data in the initializer_list *l* into the vector before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

Definition at line 1005 of file stl_vector.h.

Referenced by std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::insert().

4.1013.3.30 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::insert (iterator *__position*, size_type *__n*, const value_type & *__x*) [inline]

Inserts a number of copies of given data into the vector.

Parameters

__position	An iterator into the vector.
__n	Number of elements to be inserted.
__x	Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

Definition at line 1023 of file stl_vector.h.

4.1013.3.31 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void **std::vector**< _Tp, _Alloc >::insert (iterator *__position,* _InputIterator *__first,* _InputIterator *__last*) `[inline]`

Inserts a range into the vector.

Parameters

__position	An iterator into the vector.
__first	An input iterator.
__last	An input iterator.

This function will insert copies of the data in the range [__first,__last) into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

Definition at line 1044 of file stl_vector.h.

4.1013.3.32 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type **std::vector**< _Tp, _Alloc >::max_size ( ) const `[inline]`, `[noexcept]`

Returns the size() of the largest possible vector.

Definition at line 650 of file stl_vector.h.

4.1013.3.33 template<typename _Tp , typename _Alloc > **vector**< _Tp, _Alloc > & vector::operator= (const **vector**< _Tp, _Alloc > & *__x*)

Vector assignment operator.

Parameters

__x	A vector of identical element and allocator types.

All the elements of *__x* are copied, but any extra memory in *__x* (for fast expansion) will not be copied. Unlike the copy constructor, the allocator object is not copied.

Definition at line 161 of file vector.tcc.

References std::_Destroy(), std::begin(), std::vector< _Tp, _Alloc >::begin(), std::end(), std::vector< _Tp, _Alloc >::end(), std::vector< _Tp, _Alloc >::size(), and std::size().

4.1013.3.34 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> **vector&** **std::vector**< _Tp, _Alloc >::operator= (**vector**< _Tp, _Alloc > && *__x*) `[inline]`, `[noexcept]`

Vector move assignment operator.

Parameters

__x	A vector of identical element and allocator types.

The contents of *__x* are moved into this vector (without copying, if the allocators permit it). *__x* is a valid, but unspecified vector.

Definition at line 439 of file stl_vector.h.

4.1013.3.35 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector< _Tp, _Alloc >::operator= (initializer_list< value_type > __l) [inline]

Vector list assignment operator.

Parameters

__l	An initializer_list.

This function fills a vector with copies of the elements in the initializer list *__l*.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 461 of file stl_vector.h.

4.1013.3.36 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::operator[] (size_type __n) [inline]

Subscript access to the data contained in the vector.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

Definition at line 770 of file stl_vector.h.

4.1013.3.37 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc >::operator[] (size_type __n) const [inline]

Subscript access to the data contained in the vector.

Parameters

__n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

Definition at line 785 of file stl_vector.h.

4.1013.3.38 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::pop_back ( ) [inline]

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

Definition at line 937 of file stl_vector.h.

4.1013.3.39 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::push_back (const value_type & __x) [inline]

Add data to the end of the vector.

Parameters

__x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 901 of file stl_vector.h.

Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

4.1013.3.40 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector< _Tp, _Alloc >::rbegin ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 574 of file stl_vector.h.

4.1013.3.41 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector< _Tp, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 583 of file stl_vector.h.

4.1013.3.42 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector< _Tp, _Alloc >::rend ( ) [inline], [noexcept]

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 592 of file stl_vector.h.

4.1013.3.43 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector< _Tp, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 601 of file stl_vector.h.

4.1013.3.44 template<typename _Tp , typename _Alloc > void vector::reserve (size_type __n)

Attempt to preallocate enough memory for specified number of elements.

Parameters

__n	Number of elements required.

Exceptions

std::length_error	If *n* exceeds `max_size()`.

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than max_size(), length_error is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

Definition at line 66 of file vector.tcc.

References std::_Destroy(), and std::size().

4.1013.3.45 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::resize (size_type *__new_size*) `[inline]`

Resizes the vector to the specified number of elements.

Parameters

__new_size	Number of elements the vector should contain.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 664 of file stl_vector.h.

Referenced by __gnu_parallel::__shrink_and_double(), __gnu_parallel::multiway_merge_exact_splitting(), and __gnu_parallel::parallel_sort_mwms().

4.1013.3.46 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::resize (size_type *__new_size*, const value_type & *__x*) `[inline]`

Resizes the vector to the specified number of elements.

Parameters

__new_size	Number of elements the vector should contain.
__x	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 684 of file stl_vector.h.

4.1013.3.47 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::shrink_to_fit ( ) `[inline]`

A non-binding request to reduce capacity() to size().

Definition at line 716 of file stl_vector.h.

4.1013.3.48 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::size ( ) const `[inline]`, `[noexcept]`

Returns the number of elements in the vector.

Definition at line 645 of file stl_vector.h.

Referenced by __gnu_parallel::__shrink(), __gnu_parallel::__shrink_and_double(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::_M_range_check(), __gnu_parallel::list_partition(), std::discrete_distribution< _IntType >::max(), std::vector< _Tp, _Alloc >::operator=(), std::operator==(), and std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::resize().

4.1013.3.49 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::swap (vector< _Tp, _Alloc > & *__x*) [inline], [noexcept]

Swaps data with another vector.

Parameters

__x	A vector of the same element and allocator types.

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(v1,v2) will feed to this function.

Definition at line 1108 of file stl_vector.h.

Referenced by std::swap().

4.1014.1 Detailed Description

template<typename _Alloc>class std::vector< bool, _Alloc >

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Template Parameters

_Alloc	Allocator type.

Note that vector<bool> does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to bool. See DR96 for details.

See Also

vector for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ([]) access is also provided as with C-style arrays.

Definition at line 518 of file stl_bvector.h.

The documentation for this class was generated from the following files:

- stl_bvector.h
- vector.tcc

4.1016.1 Detailed Description

template<typename _RealType = double>class std::weibull_distribution< _RealType >

A weibull_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha,\beta) = \frac{\alpha}{\beta} (\frac{x}{\beta})^{\alpha-1} \exp{(-(\frac{x}{\beta})^{\alpha})}$$

Definition at line 4847 of file random.h.

4.1016.2 Member Typedef Documentation

4.1016.2.1 template<typename _RealType = double> typedef _RealType std::weibull_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 4850 of file random.h.

4.1016.3 Member Function Documentation

4.1016.3.1 template<typename _RealType = double> _RealType std::weibull_distribution< _RealType >::a ( ) const [inline]

Return the a parameter of the distribution.

Definition at line 4905 of file random.h.

4.1016.3.2 template<typename _RealType = double> _RealType std::weibull_distribution< _RealType >::b ( ) const [inline]

Return the b parameter of the distribution.

Definition at line 4912 of file random.h.

4.1016.3.3 template<typename _RealType = double> result_type std::weibull_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 4941 of file random.h.

References std::numeric_limits< _Tp >::max().

4.1016.3.4 template<typename _RealType = double> result_type std::weibull_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 4934 of file random.h.

4.1016.3.5 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::weibull_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & *__urng*) [inline]

Generating functions.

Definition at line 4949 of file random.h.

References std::weibull_distribution< _RealType >::operator()().

Referenced by std::weibull_distribution< _RealType >::operator()().

4.1016.3.6 template<typename _RealType = double> param_type std::weibull_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 4919 of file random.h.

Referenced by std::operator>>().

4.1016.3.7 template<typename _RealType = double> void std::weibull_distribution< _RealType >::param (const param_type & *__param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 4927 of file random.h.

4.1016.3.8 template<typename _RealType = double> void std::weibull_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 4898 of file random.h.

4.1016.4 Friends And Related Function Documentation

4.1016.4.1 template<typename _RealType = double> bool operator== (const weibull_distribution< _RealType > & *__d1*, const weibull_distribution< _RealType > & *__d2*) [friend]

Return true if two Weibull distributions have the same parameters.

Definition at line 4984 of file random.h.

5.1.1 Detailed Description

Parallel STL function calls corresponding to the stl_algo.h header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file algo.h.

Variables

- void $*$ **std::__b**

5.6.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <algorithm>.

Definition in file bits/algorithmfwd.h.

5.7.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file parallel/algorithmfwd.h.

5.8 alloc_traits.h File Reference

Classes

- struct std::allocator_traits< _Alloc >

  Uniform interface to all allocator types.

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_ALLOC_TR_NESTED_TYPE**(_NTYPE, _ALT)

Typedefs

- template<typename _Alloc >
  using **std::__check_copy_constructible** = __allow_copy_cons< __is_copy_insertable< _Alloc >::value >

Functions

- template<typename _Alloc >
  void **std::__alloc_on_copy** (_Alloc &__one, const _Alloc &__two)
- template<typename _Alloc >
  _Alloc **std::__alloc_on_copy** (const _Alloc &__a)
- template<typename _Alloc >
  void **std::__alloc_on_move** (_Alloc &__one, _Alloc &__two)
- template<typename _Alloc >
  void **std::__alloc_on_swap** (_Alloc &__one, _Alloc &__two)
- template<typename _Alloc >
  void **std::__do_alloc_on_copy** (_Alloc &__one, const _Alloc &__two, true_type)
- template<typename _Alloc >
  void **std::__do_alloc_on_move** (_Alloc &__one, _Alloc &__two, true_type)
- template<typename _Alloc >
  void **std::__do_alloc_on_swap** (_Alloc &__one, _Alloc &__two, true_type)

5.8.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <memory>.

Definition in file bits/alloc_traits.h.

5.9 alloc_traits.h File Reference

Classes

- struct __gnu_cxx::__alloc_traits< _Alloc >

  Uniform interface to C++98 and C++0x allocators.
- struct std::allocator< _Tp >

  The standard allocator, as per [20.4].

Namespaces

- namespace __gnu_cxx
- namespace std

5.9.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file ext/alloc_traits.h.

5.10 allocator.h File Reference

Classes

- struct std::allocator< _Tp >

  The standard allocator, as per [20.4].
- class std::allocator< void >

  allocator<void> specialization.
- struct uses_allocator< typename, typename >

  Declare uses_allocator so it can be specialized in <queue> etc.

Namespaces

- namespace std

Functions

- template<typename _T1 , typename _T2 >
  bool **std::operator!=** (const allocator< _T1 > &, const allocator< _T2 > &)
- template<typename _Tp >
  bool **std::operator!=** (const allocator< _Tp > &, const allocator< _Tp > &)
- template<typename _T1 , typename _T2 >
  bool **std::operator==** (const allocator< _T1 > &, const allocator< _T2 > &)
- template<typename _Tp >
  bool **std::operator==** (const allocator< _Tp > &, const allocator< _Tp > &)

5.10.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <memory>.

Definition in file allocator.h.

5.11 array File Reference

Classes

- struct std::array< _Tp, _Nm >

  A standard container for storing a fixed size sequence of elements.
- class tuple_element< _Int, _Tp >

  tuple_element
- class tuple_size< _Tp >

  tuple_size

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_ARRAY**

Functions

- template<std::size_t _Int, typename _Tp , std::size_t _Nm>
  constexpr _Tp & **std::get** (array< _Tp, _Nm > &__arr) noexcept
- template<std::size_t _Int, typename _Tp , std::size_t _Nm>
  constexpr _Tp && **std::get** (array< _Tp, _Nm > &&__arr) noexcept
- template<std::size_t _Int, typename _Tp , std::size_t _Nm>

- template<typename _Tp , std::size_t _Nm>
  void **std::swap** (array< _Tp, _Nm > &__one, array< _Tp, _Nm > &__two) noexcept(noexcept(__one.swap(__two)))

5.11.1 Detailed Description

This is a Standard C++ Library header.

Definition in file array.

5.12 array_allocator.h File Reference

Classes

- class __gnu_cxx::array_allocator< _Tp, _Array >

  An allocator that uses previously allocated memory. This memory can be externally, globally, or otherwise allocated.
- class __gnu_cxx::array_allocator_base< _Tp >

  Base class.

Namespaces

- namespace __gnu_cxx

Functions

- template<typename _Tp , typename _Array >
  bool **__gnu_cxx::operator!=** (const array_allocator< _Tp, _Array > &, const array_allocator< _Tp, _Array > &)
- template<typename _Tp , typename _Array >
  bool **__gnu_cxx::operator==** (const array_allocator< _Tp, _Array > &, const array_allocator< _Tp, _Array > &)

5.12.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file array_allocator.h.

5.13 assoc_container.hpp File Reference

Classes

- class __gnu_pbds::basic_branch< Key, Mapped, Tag, Node_Update, Policy_Tl, _Alloc >
- class __gnu_pbds::basic_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Resize_Policy, Store_Hash, Tag, Policy_Tl, _Alloc >
- class __gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash, _Alloc >
- class __gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >
- class __gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >
- class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >

5.13.1 Detailed Description

Contains associative containers.

Definition in file assoc_container.hpp.

5.14 atomic File Reference

Classes

- struct std::atomic< _Tp >

  Generic atomic type, primary class template.
- struct std::atomic< _Tp ∗ >

  Partial specialization for pointer types.
- struct std::atomic< bool >

  Explicit specialization for bool.
- struct std::atomic< char >

  Explicit specialization for char.
- struct std::atomic< char16_t >

  Explicit specialization for char16_t.
- struct std::atomic< char32_t >

  Explicit specialization for char32_t.
- struct std::atomic< int >

  Explicit specialization for int.
- struct std::atomic< long >

  Explicit specialization for long.
- struct std::atomic< long long >

  Explicit specialization for long long.
- struct std::atomic< short >

  Explicit specialization for short.
- struct std::atomic< signed char >

  Explicit specialization for signed char.
- struct std::atomic< unsigned char >

  Explicit specialization for unsigned char.
- struct std::atomic< unsigned int >

  Explicit specialization for unsigned int.

- struct std::atomic< unsigned long >

  Explicit specialization for unsigned long.
- struct std::atomic< unsigned long long >

  Explicit specialization for unsigned long long.
- struct std::atomic< unsigned short >

  Explicit specialization for unsigned short.
- struct std::atomic< wchar_t >

  Explicit specialization for wchar_t.
- struct std::atomic_bool

  atomic_bool

Namespaces

- namespace std

Macros

- template<typename _RAIter , typename _Compare >
  void __gnu_parallel::__qsb_local_sort_with_helping (_QSBThreadLocal< _RAIter > **__tls, _Compare &__comp, _ThreadIndex __iam, bool __wait)

5.21.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort. It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file balanced_quicksort.h.

5.22 base.h File Reference

Namespaces

- namespace __gnu_profile
- namespace std
- namespace std::__profile

5.22.1 Detailed Description

Sequential helper functions. This file is a GNU profile extension to the Standard C++ Library.

Definition in file profile/base.h.

5.23 base.h File Reference

Classes

- class __gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >

  Similar to std::binder1st, but giving the argument types explicitly.
- class __gnu_parallel::__binder2nd< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >

  Similar to std::binder2nd, but giving the argument types explicitly.
- class __gnu_parallel::__unary_negate< _Predicate, argument_type >

  Similar to std::unary_negate, but giving the argument types explicitly.
- class __gnu_parallel::_EqualFromLess< _T1, _T2, _Compare >

  Constructs predicate for equality from strict weak ordering predicate.
- struct __gnu_parallel::_EqualTo< _T1, _T2 >

  Similar to std::equal_to, but allows two different types.
- struct __gnu_parallel::_Less< _T1, _T2 >

  Similar to std::less, but allows two different types.
- struct __gnu_parallel::_Multiplies< _Tp1, _Tp2, _Result >

  Similar to std::multiplies, but allows two different types.
- struct __gnu_parallel::_Plus< _Tp1, _Tp2, _Result >

  Similar to std::plus, but allows two different types.
- class __gnu_parallel::_PseudoSequence< _Tp, _DifferenceTp >

  Sequence that conceptually consists of multiple copies of the same element. The copies are not stored explicitly, of course.
- class __gnu_parallel::_PseudoSequenceIterator< _Tp, _DifferenceTp >

  _Iterator associated with __gnu_parallel::_PseudoSequence. If features the usual random-access iterator functionality.

Namespaces

- namespace __gnu_parallel
- namespace __gnu_sequential
- namespace std
- namespace std::__parallel

Macros

- #define **_GLIBCXX_PARALLEL_ASSERT**(_Condition)

Functions

- void __gnu_parallel::__decode2 (_CASable __x, int &__a, int &__b)
- _CASable __gnu_parallel::__encode2 (int __a, int __b)
- _ThreadIndex **__gnu_parallel::__get_max_threads** ()
- bool **__gnu_parallel::__is_parallel** (const _Parallelism __p)
- template<typename _RAIter , typename _Compare >
  _RAIter __gnu_parallel::__median_of_three_iterators (_RAIter __a, _RAIter __b, _RAIter __c, _Compare __comp)
- template<typename _Size >
  _Size __gnu_parallel::__rd_log2 (_Size __n)
- template<typename _Tp >
  const _Tp & __gnu_parallel::max (const _Tp &__a, const _Tp &__b)
- template<typename _Tp >
  const _Tp & __gnu_parallel::min (const _Tp &__a, const _Tp &__b)

5.23.1 Detailed Description

Sequential helper functions. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file parallel/base.h.

5.24 basic_file.h File Reference

Namespaces

- namespace std

5.24.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ios>.

Definition in file basic_file.h.

5.25 basic_ios.h File Reference

Classes

- class std::basic_ios< _CharT, _Traits >

  Template class basic_ios, virtual base class for all stream classes.

Namespaces

- namespace std

Functions

- template<typename _Facet >
  const _Facet & **std::__check_facet** (const _Facet *__f)

5.25.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ios>.

Definition in file basic_ios.h.

5.26 basic_ios.tcc File Reference

Namespaces

- namespace std

Macros

- #define **_BASIC_IOS_TCC**

5.26.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ios>.

Definition in file basic_ios.tcc.

5.27 basic_iterator.h File Reference

5.27.1 Detailed Description

Includes the original header files concerned with iterators except for stream iterators. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file basic_iterator.h.

5.28 basic_string.h File Reference

Classes

- class std::basic_string< _CharT, _Traits, _Alloc >

  Managing sequences of characters and character-like objects.
- struct std::hash< string >

  std::hash specialization for string.
- struct std::hash< u16string >

  std::hash specialization for u16string.
- struct std::hash< u32string >

  std::hash specialization for u32string.
- struct std::hash< wstring >

  std::hash specialization for wstring.

Namespaces

- namespace std

Functions

- template<typename _CharT , typename _Traits , typename _Alloc >
  basic_istream< _CharT, _Traits > & std::getline (basic_istream< _CharT, _Traits > &__is, basic_string< _CharT, _Traits, _Alloc > &__str, _CharT __delim)
- template<typename _CharT , typename _Traits , typename _Alloc >

5.34.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file binomial_heap_base_.hpp.

5.35 bitmap_allocator.h File Reference

Classes

- class __gnu_cxx::__detail::__mini_vector< _Tp >

  __mini_vector<> is a stripped down version of the full-fledged std::vector<>.
- class __gnu_cxx::__detail::_Bitmap_counter< _Tp >

  The bitmap counter which acts as the bitmap manipulator, and manages the bit-manipulation functions and the searching and identification functions on the bit-map.
- class __gnu_cxx::__detail::_Ffit_finder< _Tp >

  The class which acts as a predicate for applying the first-fit memory allocation policy for the bitmap allocator.
- class __gnu_cxx::bitmap_allocator< _Tp >

  Bitmap Allocator, primary template.
- class __gnu_cxx::free_list

  The free list class for managing chunks of memory to be given to and returned by the bitmap_allocator.

Namespaces

- namespace __gnu_cxx
- namespace __gnu_cxx::__detail

Macros

- #define _BALLOC_ALIGN_BYTES

Enumerations

5.41.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.

Definition in file boost_concept_check.h.

5.42 branch_policy.hpp File Reference

Classes

- struct __gnu_pbds::detail::branch_policy< Node_CItr, Node_Itr, _Alloc >

  Primary template, base class for branch structure policies.
- struct __gnu_pbds::detail::branch_policy< Node_CItr, Node_CItr, _Alloc >

  Specialization for const iterators.

Namespaces

- namespace __gnu_pbds

5.42.1 Detailed Description

Contains a base class for branch policies.

Definition in file branch_policy.hpp.

5.43 c++0x_warning.h File Reference

5.43.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iosfwd>.

Definition in file c++0x_warning.h.

5.44 c++allocator.h File Reference

Namespaces

- namespace std

Typedefs

- template<typename _Tp >
  using std::__allocator_base = __gnu_cxx::new_allocator< _Tp >

5.44.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <memory>.

Definition in file c++allocator.h.

5.45 c++config.h File Reference

- #define **PB_DS_HASH_EQ_FN_C_DEC**
- #define **PB_DS_RANGED_HASH_FN_C_DEC**

5.52.1 Detailed Description

Contains an implementation class for cc_ht_map_.

Definition in file cc_ht_map_.hpp.

5.53 ccomplex File Reference

Macros

- #define **_GLIBCXX_CCOMPLEX**

5.53.1 Detailed Description

This is a Standard C++ Library header.

Definition in file ccomplex.

5.54 ccomplex File Reference

Macros

- #define **_GLIBCXX_TR1_CCOMPLEX**

5.54.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/ccomplex.

5.55 cctype File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CCTYPE**

5.55.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the ∗.h implementation files.

This is the C++ version of the Standard C Library header `ctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cctype.

5.56 cctype File Reference

Macros

- #define **_GLIBCXX_TR1_CCTYPE**

5.56.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cctype.

5.57 cerrno File Reference

Macros

- #define **_GLIBCXX_CERRNO**
- #define **errno**

5.57.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cerrno.

5.58 cfenv File Reference

Macros

- #define **_GLIBCXX_CFENV**

5.58.1 Detailed Description

This is a Standard C++ Library header.

Definition in file cfenv.

5.59 cfenv File Reference

Macros

- #define **_GLIBCXX_TR1_CFENV**

5.59.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cfenv.

5.60 cfloat File Reference

Macros

- #define **_GLIBCXX_CFLOAT**
- #define **DECIMAL_DIG**
- #define **FLT_EVAL_METHOD**

5.60.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cfloat.

5.61 cfloat File Reference

Macros

- #define **_GLIBCXX_TR1_CFLOAT**

5.61.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cfloat.

5.62 char_traits.h File Reference

Classes

- struct __gnu_cxx::_Char_types< _CharT >

  Mapping from character type to associated types.
- struct __gnu_cxx::char_traits< _CharT >

  Base class used to implement std::char_traits.
- struct std::char_traits< _CharT >

  Basis for explicit traits specializations.
- struct std::char_traits< char >

  21.1.3.1 char_traits specializations
- struct std::char_traits< wchar_t >

  21.1.3.2 char_traits specializations

Namespaces

- namespace __gnu_cxx
- namespace std

5.62.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <string>.

Definition in file char_traits.h.

5.63 checkers.h File Reference

Namespaces

- namespace __gnu_parallel

Functions

- template<typename _IIter , typename _Compare >
  bool __gnu_parallel::__is_sorted (_IIter __begin, _IIter __end, _Compare __comp)

5.63.1 Detailed Description

Routines for checking the correctness of algorithm results. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file checkers.h.

5.64 chrono File Reference

5.64.1 Detailed Description

This is a Standard C++ Library header.

Definition in file chrono.

5.65 cinttypes File Reference

Macros

- #define **_GLIBCXX_CINTTYPES**

5.65.1 Detailed Description

This is a Standard C++ Library header.

Definition in file cinttypes.

5.66 cinttypes File Reference

Macros

- #define **_GLIBCXX_TR1_CINTTYPES**

5.66.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cinttypes.

5.67 ciso646 File Reference

5.67.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `iso646.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file ciso646.

5.68 climits File Reference

Macros

- #define **_GLIBCXX_CLIMITS**
- #define **LLONG_MAX**
- #define **LLONG_MIN**
- #define **ULLONG_MAX**

5.68.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `limits.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file climits.

5.69 climits File Reference

Macros

- #define **_GLIBCXX_TR1_CLIMITS**

5.69.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/climits.

5.70 clocale File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CLOCALE**

5.70.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `locale.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file clocale.

5.72.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cmath.

5.73 cmp_fn_imps.hpp File Reference

5.73.1 Detailed Description

Contains implementations of cc_ht_map_'s entire container comparison related functions.

Definition in file cmp_fn_imps.hpp.

5.74 codecvt.h File Reference

Classes

- class std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >

  Common base for codecvt functions.
- class std::codecvt< _InternT, _ExternT, _StateT >

  Primary class template codecvt.
  NB: Generic, mostly useless implementation.
- class std::codecvt< char, char, mbstate_t >

  class codecvt<char, char, mbstate_t> specialization.
- class std::codecvt< wchar_t, char, mbstate_t >

  class codecvt<wchar_t, char, mbstate_t> specialization.
- class std::codecvt_base

  Empty base class for codecvt facet [22.2.1.5].
- class std::codecvt_byname< _InternT, _ExternT, _StateT >

  class codecvt_byname [22.2.1.6].

Namespaces

- namespace std

5.74.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

Definition in file codecvt.h.

5.75 codecvt_specializations.h File Reference

Classes

- struct __gnu_cxx::encoding_char_traits< _CharT >

  encoding_char_traits

- class __gnu_cxx::encoding_state

  Extension to use iconv for dealing with character encodings.
- class std::codecvt< _InternT, _ExternT, encoding_state >

  codecvt< InternT, _ExternT, encoding_state> specialization.

Namespaces

- namespace __gnu_cxx
- namespace std

Functions

- template<typename _Tp >
  size_t **std::__iconv_adaptor** (size_t(∗__func)(iconv_t, _Tp, size_t ∗, char ∗∗, size_t ∗), iconv_t __cd, char ∗∗__inbuf, size_t ∗__inbytes, char ∗∗__outbuf, size_t ∗__outbytes)

5.75.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file codecvt_specializations.h.

5.76 compatibility.h File Reference

5.76.1 Detailed Description

This is an internal header file, included by other library sources. You should not attempt to use it directly.

Definition in file x86_64-unknown-linux-gnu/bits/compatibility.h.

5.77 compatibility.h File Reference

Namespaces

- #define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB
- #define _GLIBCXX_SCALE_DOWN_FPU
- #define _GLIBCXX_VERBOSE_LEVEL

5.78.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file compiletime_settings.h.

5.78.2 Macro Definition Documentation

5.78.2.1 #define _GLIBCXX_ASSERTIONS

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Should be switched on only locally.

Definition at line 61 of file compiletime_settings.h.

Referenced by __gnu_parallel::__qsb_local_sort_with_helping().

5.78.2.2 #define _GLIBCXX_CALL(*__n*)

Macro to produce log message when entering a function.

Parameters

__n	Input size.

See Also

_GLIBCXX_VERBOSE_LEVEL

Definition at line 44 of file compiletime_settings.h.

Referenced by __gnu_parallel::__find_template(), __gnu_parallel::__for_each_template_random_access_workstealing(), __gnu_parallel::__merge_advance(), __gnu_parallel::__parallel_nth_element(), __gnu_parallel::__parallel_partial_sum(), __gnu_parallel::__parallel_partition(), __gnu_parallel::__parallel_random_shuffle_drs(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort_qs(), __gnu_parallel::__parallel_sort_qsb(), __gnu_parallel::__parallel_unique_copy(), __gnu_parallel::__search_template(), __gnu_parallel::__sequential_multiway_merge(), __gnu_parallel::multiseq_partition(), __gnu_parallel::multiseq_selection(), __gnu_parallel::multiway_merge(), __gnu_-

5.78.2.3 #define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Consider the size of the L1 cache for gnu_parallel::__parallel_random_shuffle().

Definition at line 68 of file compiletime_settings.h.

5.78.2.4 #define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Consider the size of the TLB for gnu_parallel::__parallel_random_shuffle().

Definition at line 74 of file compiletime_settings.h.

5.78.2.5 #define _GLIBCXX_SCALE_DOWN_FPU

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

Definition at line 55 of file compiletime_settings.h.

5.78.2.6 #define _GLIBCXX_VERBOSE_LEVEL

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

Definition at line 37 of file compiletime_settings.h.

Variables

- static const _Lock_policy **__gnu_cxx::__default_lock_policy**

5.83.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file concurrence.h.

5.84 cond_dealtor.hpp File Reference

Classes

- class __gnu_pbds::detail::cond_dealtor< Entry, _Alloc >
  Conditional deallocate constructor argument.

Namespaces

- namespace __gnu_pbds

5.84.1 Detailed Description

Contains a conditional deallocator.

Definition in file cond_dealtor.hpp.

5.85 cond_key_dtor_entry_dealtor.hpp File Reference

Classes

- class __gnu_pbds::detail::cond_dealtor< Entry, _Alloc >

  Conditional deallocate constructor argument.

Namespaces

- namespace __gnu_pbds

5.85.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

Definition in file cond_key_dtor_entry_dealtor.hpp.

5.86 condition_variable File Reference

Classes

- class std::condition_variable

  condition_variable
- class std::condition_variable_any

  condition_variable_any

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CONDITION_VARIABLE**

Enumerations

- enum std::cv_status

5.86.1 Detailed Description

This is a Standard C++ Library header.

Definition in file condition_variable.

5.87 const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry, Simple, _Alloc >

  Const point-type iterator.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_BIN_HEAP_CIT_BASE**

5.87.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

Definition in file binary_heap_/const_iterator.hpp.

5.88 const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >

  Const point-type iterator.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_BASIC_HEAP_CIT_BASE**
- #define **PB_DS_CLASS_C_DEC**

5.88.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

Definition in file left_child_next_sibling_heap_/const_iterator.hpp.

5.89 const_iterator.hpp File Reference

Classes

- class const_iterator_

  Const range-type iterator.

5.89.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.

Definition in file unordered_iterator/const_iterator.hpp.

5.90 constructor_destructor_fn_imps.hpp File Reference

5.90.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

Definition in file cc_hash_table_map_/constructor_destructor_fn_imps.hpp.

5.91 constructor_destructor_fn_imps.hpp File Reference

5.91.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

Definition in file gp_hash_table_map_/constructor_destructor_fn_imps.hpp.

5.92 constructor_destructor_fn_imps.hpp File Reference

5.93 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.93.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

Definition in file cc_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp.

5.94 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.94.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

Definition in file gp_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp.

5.95 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.95.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

Definition in file cc_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp.

5.96 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.96.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

Definition in file gp_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp.

5.97 constructors_destructor_fn_imps.hpp File Reference

5.97.1 Detailed Description

Contains an implementation class for binary_heap_.

Definition in file binary_heap_/constructors_destructor_fn_imps.hpp.

5.98 constructors_destructor_fn_imps.hpp File Reference

5.98.1 Detailed Description

Contains an implementation for binomial_heap_.

Definition in file binomial_heap_/constructors_destructor_fn_imps.hpp.

5.99 constructors_destructor_fn_imps.hpp File Reference

5.99.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file binomial_heap_base_/constructors_destructor_fn_imps.hpp.

5.100 constructors_destructor_fn_imps.hpp File Reference

5.100.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file bin_search_tree_/constructors_destructor_fn_imps.hpp.

5.101 constructors_destructor_fn_imps.hpp File Reference

5.101.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

Definition in file left_child_next_sibling_heap_/constructors_destructor_fn_imps.hpp.

5.102 constructors_destructor_fn_imps.hpp File Reference

5.102.1 Detailed Description

Contains an implementation class for ov_tree_.

Definition in file ov_tree_map_/constructors_destructor_fn_imps.hpp.

5.103 constructors_destructor_fn_imps.hpp File Reference

5.103.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file pairing_heap_/constructors_destructor_fn_imps.hpp.

5.104 constructors_destructor_fn_imps.hpp File Reference

5.104.1 Detailed Description

Contains an implementation class for pat_trie.

Definition in file pat_trie_/constructors_destructor_fn_imps.hpp.

5.105 constructors_destructor_fn_imps.hpp File Reference

5.105.1 Detailed Description

Contains an implementation for rb_tree_.

Definition in file rb_tree_map_/constructors_destructor_fn_imps.hpp.

5.106 constructors_destructor_fn_imps.hpp File Reference

5.106.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

Definition in file rc_binomial_heap_/constructors_destructor_fn_imps.hpp.

5.107 constructors_destructor_fn_imps.hpp File Reference

5.107.1 Detailed Description

Contains an implementation class for splay_tree_.

Definition in file splay_tree_/constructors_destructor_fn_imps.hpp.

5.108 constructors_destructor_fn_imps.hpp File Reference

5.108.1 Detailed Description

Contains an implementation for thin_heap_.

Definition in file thin_heap_/constructors_destructor_fn_imps.hpp.

5.109 container_base_dispatch.hpp File Reference

Classes

- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_Tl >

  Specialization colision-chaining hash map.

5.109.1 Detailed Description

Contains associative container dispatching.

Definition in file container_base_dispatch.hpp.

5.110 cpp_type_traits.h File Reference

Namespaces

- namespace __gnu_cxx
- namespace std

5.110.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ext/type_traits>.

Definition in file cpp_type_traits.h.

5.111 cpu_defines.h File Reference

5.111.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iosfwd>.

Definition in file cpu_defines.h.

5.112 csetjmp File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSETJMP**
- #define **setjmp**(env)

5.112.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file csetjmp.

5.113 csignal File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSIGNAL**

5.113.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file csignal.

5.114 cstdarg File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDARG**
- #define **va_end**(ap)

5.114.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cstdarg.

5.115 cstdarg File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDARG**

5.115.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cstdarg.

5.116 cstdbool File Reference

Macros

- #define **_GLIBCXX_CSTDBOOL**

5.116.1 Detailed Description

This is a Standard C++ Library header.

Definition in file cstdbool.

5.117 cstdbool File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDBOOL**

5.117.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cstdbool.

5.118 cstddef File Reference

5.118.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the $*$.h implementation files.

This is the C++ version of the Standard C Library header `stddef.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cstddef.

5.119 cstdint File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDINT**

5.119.1 Detailed Description

This is a Standard C++ Library header.

Definition in file cstdint.

5.120 cstdint File Reference

Namespaces

- namespace std
- namespace std::tr1

Macros

- #define **_GLIBCXX_TR1_CSTDINT**

5.120.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cstdint.

5.121 cstdio File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDIO**

Functions

- char ∗ **gets** (char ∗__s) __attribute__((deprecated))

5.121.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cstdio.

5.122 cstdio File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDIO**

5.122.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cstdio.

5.123 cstdlib File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDLIB**
- #define **EXIT_FAILURE**
- #define **EXIT_SUCCESS**

Functions

- void **std::abort** (void) throw ()
- int **std::atexit** (void(*)()) throw ()
- void **std::exit** (int) throw ()

5.123.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cstdlib.

5.124 cstdlib File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDLIB**

5.124.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/cstdlib.

5.125 cstring File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTRING**

Functions

- void ∗ **std::memchr** (void ∗__s, int __c, size_t __n)
- char ∗ **std::strchr** (char ∗__s, int __n)
- char ∗ **std::strpbrk** (char ∗__s1, const char ∗__s2)
- char ∗ **std::strrchr** (char ∗__s, int __n)
- char ∗ **std::strstr** (char ∗__s1, const char ∗__s2)

5.125.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the ∗.h implementation files.

This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cstring.

5.126 ctgmath File Reference

Macros

- #define **_GLIBCXX_CTGMATH**

5.126.1 Detailed Description

This is a Standard C++ Library header.

Definition in file ctgmath.

5.127 ctgmath File Reference

Macros

- #define **_GLIBCXX_TR1_CTGMATH**

5.127.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/ctgmath.

5.128 ctime File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CTIME**

5.128.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the ∗.h implementation files.

This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file ctime.

5.129 ctime File Reference

Macros

- #define **_GLIBCXX_TR1_CTIME**

5.129.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file tr1/ctime.

5.130 ctype_base.h File Reference

Classes

- struct std::ctype_base
  Base class for ctype.

Namespaces

- namespace std

5.130.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

Definition in file ctype_base.h.

5.131 ctype_inline.h File Reference

Namespaces

- namespace std

5.131.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

Definition in file ctype_inline.h.

5.132 cwchar File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CWCHAR**

Functions

- wchar_t ∗ **std::wcschr** (wchar_t ∗__p, wchar_t __c)

5.139.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file debug.h.

5.140 debug_allocator.h File Reference

Classes

- class __gnu_cxx::debug_allocator< _Alloc >

    A meta-allocator with debugging bits, as per [20.4].
    This is precisely the allocator defined in the C++ Standard.

Namespaces

- namespace __gnu_cxx

5.140.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file debug_allocator.h.

5.141 debug_fn_imps.hpp File Reference

5.141.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file binary_heap_/debug_fn_imps.hpp.

5.142 debug_fn_imps.hpp File Reference

5.142.1 Detailed Description

Contains an implementation for binomial_heap_.

Definition in file binomial_heap_/debug_fn_imps.hpp.

5.143 debug_fn_imps.hpp File Reference

5.143.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file binomial_heap_base_/debug_fn_imps.hpp.

5.144 debug_fn_imps.hpp File Reference

5.144.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file bin_search_tree_/debug_fn_imps.hpp.

5.145 debug_fn_imps.hpp File Reference

5.145.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

Definition in file cc_hash_table_map_/debug_fn_imps.hpp.

5.146 debug_fn_imps.hpp File Reference

5.146.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

Definition in file gp_hash_table_map_/debug_fn_imps.hpp.

5.147 debug_fn_imps.hpp File Reference

5.147.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

Definition in file left_child_next_sibling_heap_/debug_fn_imps.hpp.

5.148 debug_fn_imps.hpp File Reference

5.148.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

Definition in file list_update_map_/debug_fn_imps.hpp.

5.149 debug_fn_imps.hpp File Reference

5.149.1 Detailed Description

Contains an implementation class for ov_tree_.

Definition in file ov_tree_map_/debug_fn_imps.hpp.

5.150 debug_fn_imps.hpp File Reference

5.150.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file pairing_heap_/debug_fn_imps.hpp.

5.151 debug_fn_imps.hpp File Reference

5.151.1 Detailed Description

Contains an implementation class for pat_trie_.

Definition in file pat_trie_/debug_fn_imps.hpp.

5.152 debug_fn_imps.hpp File Reference

5.152.1 Detailed Description

Contains an implementation for rb_tree_.

Definition in file rb_tree_map_/debug_fn_imps.hpp.

5.153 debug_fn_imps.hpp File Reference

5.153.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

Definition in file rc_binomial_heap_/debug_fn_imps.hpp.

5.154 debug_fn_imps.hpp File Reference

5.154.1 Detailed Description

Contains an implementation class for splay_tree_.

Definition in file splay_tree_/debug_fn_imps.hpp.

5.155 debug_fn_imps.hpp File Reference

5.155.1 Detailed Description

Contains an implementation for thin_heap_.

Definition in file thin_heap_/debug_fn_imps.hpp.

5.156 debug_map_base.hpp File Reference

5.156.1 Detailed Description

Contains a debug-mode base for all maps.

Definition in file debug_map_base.hpp.

5.157 debug_no_store_hash_fn_imps.hpp File Reference

5.157.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

Definition in file cc_hash_table_map_/debug_no_store_hash_fn_imps.hpp.

5.158 debug_no_store_hash_fn_imps.hpp File Reference

5.158.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

Definition in file gp_hash_table_map_/debug_no_store_hash_fn_imps.hpp.

5.159 debug_store_hash_fn_imps.hpp File Reference

5.159.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

Definition in file cc_hash_table_map_/debug_store_hash_fn_imps.hpp.

5.160 debug_store_hash_fn_imps.hpp File Reference

5.160.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

Definition in file gp_hash_table_map_/debug_store_hash_fn_imps.hpp.

5.161.1 Detailed Description

This is a Standard C++ Library header.

Definition in file decimal.

5.162 deque File Reference

Macros

- #define **_GLIBCXX_DEQUE**

5.162.1 Detailed Description

This is a Standard C++ Library header.

Definition in file deque.

5.163 deque File Reference

Classes

- class std::__debug::deque< _Tp, _Allocator >

  Class std::deque with safety/checking/debug instrumentation.

Namespaces

- namespace std
- namespace std::__debug

Macros

- #define **_GLIBCXX_DEBUG_DEQUE**

Functions

- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator!=** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator<** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator<=** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator==** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator>** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator>=** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  void **std::__debug::swap** (deque< _Tp, _Alloc > &__lhs, deque< _Tp, _Alloc > &__rhs)

5.163.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file debug/deque.

5.164 deque File Reference

Classes

- class std::__profile::deque< _Tp, _Allocator >

  Class std::deque wrapper with performance instrumentation.

Namespaces

- namespace std
- namespace std::__profile

Macros

- #define **_GLIBCXX_PROFILE_DEQUE**

Functions

- template<typename _Tp , typename _Alloc >
  bool **std::__profile::operator!=** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >

5.165.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <deque>.

Definition in file deque.tcc.

5.166 direct_mask_range_hashing_imp.hpp File Reference

5.166.1 Detailed Description

Contains a range-hashing policy implementation

Definition in file direct_mask_range_hashing_imp.hpp.

5.167 direct_mod_range_hashing_imp.hpp File Reference

5.167.1 Detailed Description

Contains a range-hashing policy implementation

Definition in file direct_mod_range_hashing_imp.hpp.

5.168 dynamic_bitset File Reference

Classes

- struct std::tr2::__dynamic_bitset_base< _WordT, _Alloc >
- class std::tr2::dynamic_bitset< _WordT, _Alloc >

  The dynamic_bitset class represents a sequence of bits.
- class std::tr2::dynamic_bitset< _WordT, _Alloc >::reference

Namespaces

- namespace std
- namespace std::tr2
- namespace std::tr2::__detail

Macros

- #define **_GLIBCXX_TR2_DYNAMIC_BITSET**

Functions

- template<typename _WordT , typename _Alloc >

  std::basic_ostream< _CharT,
  _Traits > & std::tr2::operator<< (std::basic_ostream< _CharT, _Traits > &__os, const dynamic_bitset< _WordT, _Alloc > &__x)

5.168.1 Detailed Description

This is a TR2 C++ Library header.

Definition in file dynamic_bitset.

5.169 enc_filebuf.h File Reference

Classes

- class __gnu_cxx::enc_filebuf< _CharT >

  class enc_filebuf.

Namespaces

- namespace __gnu_cxx

5.169.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file enc_filebuf.h.

5.170 entry_cmp.hpp File Reference

Classes

- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, false >

  Specialization, false.
- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, false >::type

  Compare plus entry.
- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, true >

  Specialization, true.
- struct entry_cmp< _VTp, Cmp_Fn, _Alloc, No_Throw >

  Entry compare, primary template.

Namespaces

- namespace __gnu_pbds

5.170.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file entry_cmp.hpp.

5.171 entry_list_fn_imps.hpp File Reference

5.171.1 Detailed Description

Contains implementations of cc_ht_map_'s entry-list related functions.

Definition in file entry_list_fn_imps.hpp.

5.172 entry_metadata_base.hpp File Reference

Namespaces

- namespace __gnu_pbds

5.172.1 Detailed Description

Contains an implementation for a list update map.

Definition in file entry_metadata_base.hpp.

5.173 entry_pred.hpp File Reference

Classes

- struct __gnu_pbds::detail::entry_pred< _VTp, Pred, _Alloc, false >

  Specialization, false.
- struct __gnu_pbds::detail::entry_pred< _VTp, Pred, _Alloc, true >

  Specialization, true.
- struct entry_pred< _VTp, Pred, _Alloc, No_Throw >

  Entry predicate primary class template.

Namespaces

- namespace __gnu_pbds

5.173.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file entry_pred.hpp.

5.174 eq_by_less.hpp File Reference

Classes

- struct __gnu_pbds::detail::eq_by_less< Key, Cmp_Fn >

  Equivalence function.

Namespaces

- namespace __gnu_pbds

5.174.1 Detailed Description

Contains an equivalence function.

Definition in file eq_by_less.hpp.

5.175 equally_split.h File Reference

Namespaces

- namespace __gnu_parallel

Functions

- template<typename _DifferenceType , typename _OutputIterator >
  _OutputIterator __gnu_parallel::__equally_split (_DifferenceType __n, _ThreadIndex __num_threads, _OutputIterator __s)
- template<typename _DifferenceType >
  _DifferenceType __gnu_parallel::__equally_split_point (_DifferenceType __n, _ThreadIndex __num_threads, _ThreadIndex __thread_no)

5.175.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file equally_split.h.

5.176 erase_fn_imps.hpp File Reference

5.176.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file binary_heap_/erase_fn_imps.hpp.

5.177 erase_fn_imps.hpp File Reference

5.177.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file binomial_heap_base_/erase_fn_imps.hpp.

5.178 erase_fn_imps.hpp File Reference

5.178.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file bin_search_tree_/erase_fn_imps.hpp.

5.179 erase_fn_imps.hpp File Reference

5.179.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions.

Definition in file cc_hash_table_map_/erase_fn_imps.hpp.

5.180 erase_fn_imps.hpp File Reference

5.180.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions.

Definition in file gp_hash_table_map_/erase_fn_imps.hpp.

5.181 erase_fn_imps.hpp File Reference

5.181.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

Definition in file left_child_next_sibling_heap_/erase_fn_imps.hpp.

5.182 erase_fn_imps.hpp File Reference

5.182.1 Detailed Description

Contains implementations of lu_map_.

Definition in file list_update_map_/erase_fn_imps.hpp.

5.183 erase_fn_imps.hpp File Reference

5.183.1 Detailed Description

Contains an implementation class for ov_tree_.

Definition in file ov_tree_map_/erase_fn_imps.hpp.

5.184 erase_fn_imps.hpp File Reference

5.184.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file pairing_heap_/erase_fn_imps.hpp.

5.185 erase_fn_imps.hpp File Reference

5.185.1 Detailed Description

Contains an implementation class for pat_trie.

Definition in file pat_trie_/erase_fn_imps.hpp.

5.186 erase_fn_imps.hpp File Reference

5.186.1 Detailed Description

Contains an implementation for rb_tree_.

Definition in file rb_tree_map_/erase_fn_imps.hpp.

5.187 erase_fn_imps.hpp File Reference

5.187.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

Definition in file rc_binomial_heap_/erase_fn_imps.hpp.

5.188 erase_fn_imps.hpp File Reference

5.188.1 Detailed Description

Contains an implementation class for splay_tree_.

Definition in file splay_tree_/erase_fn_imps.hpp.

5.189 erase_fn_imps.hpp File Reference

5.189.1 Detailed Description

Contains an implementation for thin_heap_.

Definition in file thin_heap_/erase_fn_imps.hpp.

5.190 erase_no_store_hash_fn_imps.hpp File Reference

5.190.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions, when the hash value is not stored.

Definition in file cc_hash_table_map_/erase_no_store_hash_fn_imps.hpp.

5.191 erase_no_store_hash_fn_imps.hpp File Reference

5.191.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions, when the hash value is not stored.

Definition in file gp_hash_table_map_/erase_no_store_hash_fn_imps.hpp.

5.192 erase_store_hash_fn_imps.hpp File Reference

5.192.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions, when the hash value is stored.

Definition in file cc_hash_table_map_/erase_store_hash_fn_imps.hpp.

5.193 erase_store_hash_fn_imps.hpp File Reference

5.193.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions, when the hash value is stored.

Definition in file gp_hash_table_map_/erase_store_hash_fn_imps.hpp.

5.194 error_constants.h File Reference

Namespaces

- namespace std

Enumerations

- enum **errc**

5.194.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <system_error>.

Definition in file error_constants.h.

5.195 exception File Reference

Classes

- class std::bad_exception
- class std::exception

  Base class for all library exceptions.

Namespaces

- namespace __gnu_cxx
- namespace std

Typedefs

- typedef void(∗ std::terminate_handler)()
- typedef void(∗ std::unexpected_handler)()

Functions

- void __gnu_cxx::__verbose_terminate_handler ()
- terminate_handler std::set_terminate (terminate_handler) noexcept
- unexpected_handler std::set_unexpected (unexpected_handler) noexcept
- void std::terminate () noexcept __attribute__((__noreturn__))
- bool std::uncaught_exception () noexcept __attribute__((__pure__))
- void std::unexpected () __attribute__((__noreturn__))

5.195.1 Detailed Description

This is a Standard C++ Library header.

Definition in file exception.

5.196 exception.hpp File Reference

Classes

- struct __gnu_pbds::container_error

  Base class for exceptions.
- struct __gnu_pbds::insert_error

  An entry cannot be inserted into a container object for logical reasons (not, e.g., if memory is unabvailable, in which case the allocator_type's exception will be thrown).
- struct __gnu_pbds::join_error

  A join cannot be performed logical reasons (i.e., the ranges of the two container objects being joined overlaps.
- struct __gnu_pbds::resize_error

  A container cannot be resized.

Namespaces

- namespace __gnu_pbds

Functions

- void **__gnu_pbds::__throw_container_error** ()
- void **__gnu_pbds::__throw_insert_error** ()
- void **__gnu_pbds::__throw_join_error** ()
- void **__gnu_pbds::__throw_resize_error** ()

5.196.1 Detailed Description

Contains exception classes.

Definition in file exception.hpp.

5.197 exception_defines.h File Reference

Macros

- #define **__catch**(X)
- #define **__throw_exception_again**
- #define **__try**

5.197.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <exception>.

Definition in file exception_defines.h.

5.198 exception_ptr.h File Reference

Classes

- class std::__exception_ptr::exception_ptr

  An opaque pointer to an arbitrary exception.

Namespaces

- namespace std

Functions

- template<typename _Ex >
  exception_ptr std::copy_exception (_Ex __ex) noexcept
- exception_ptr std::current_exception () noexcept

- template<typename _Ex >
  exception_ptr std::make_exception_ptr (_Ex __ex) noexcept
- bool **std::__exception_ptr::operator!=** (const exception_ptr &, const exception_ptr &) noexcept __attribute__((__pure__))
- bool **std::__exception_ptr::operator==** (const exception_ptr &, const exception_ptr &) noexcept __attribute__((__pure__))
- void std::rethrow_exception (exception_ptr) __attribute__((__noreturn__))
- void **std::__exception_ptr::swap** (exception_ptr &__lhs, exception_ptr &__rhs)

5.198.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <exception>.

Definition in file exception_ptr.h.

5.199 extc++.h File Reference

5.199.1 Detailed Description

This is an implementation file for a precompiled header.

Definition in file extc++.h.

5.200 extptr_allocator.h File Reference

Classes

- class __gnu_cxx::_ExtPtr_allocator< _Tp >

  An example allocator which uses a non-standard pointer type.
  This allocator specifies that containers use a 'relative pointer' as it's pointer type. (See ext/pointer.h) Memory allocation in this example is still performed using std::allocator.

Namespaces

- namespace __gnu_cxx

Functions

- template<typename _Tp >
  void **__gnu_cxx::swap** (_ExtPtr_allocator< _Tp > &__larg, _ExtPtr_allocator< _Tp > &__rarg)

5.200.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

An example allocator which uses an alternative pointer type from bits/pointer.h. Supports test cases which confirm container support for alternative pointers.

Definition in file extptr_allocator.h.

5.201 features.h File Reference

Macros

- #define _GLIBCXX_BAL_QUICKSORT
- #define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS
- #define _GLIBCXX_FIND_EQUAL_SPLIT
- #define _GLIBCXX_FIND_GROWING_BLOCKS
- #define _GLIBCXX_MERGESORT
- #define _GLIBCXX_QUICKSORT
- #define _GLIBCXX_TREE_DYNAMIC_BALANCING
- #define _GLIBCXX_TREE_FULL_COPY
- #define _GLIBCXX_TREE_INITIAL_SPLITTING

5.201.1 Detailed Description

Defines on whether to include algorithm variants. Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file features.h.

5.201.2 Macro Definition Documentation

5.201.2.1 #define _GLIBCXX_BAL_QUICKSORT

Include parallel dynamically load-balanced quicksort.

See Also

__gnu_parallel::_Settings::sort_algorithm

Definition at line 55 of file features.h.

5.201.2.2 #define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS

Include the equal-sized blocks variant for std::find.

See Also

__gnu_parallel::_Settings::find_algorithm

Definition at line 67 of file features.h.

5.201.2.3 #define _GLIBCXX_FIND_EQUAL_SPLIT

Include the equal splitting variant for std::find.

See Also

__gnu_parallel::_Settings::find_algorithm

Definition at line 74 of file features.h.

5.201.2.4 #define _GLIBCXX_FIND_GROWING_BLOCKS

Include the growing blocks variant for std::find.

See Also

__gnu_parallel::_Settings::find_algorithm

Definition at line 61 of file features.h.

5.201.2.5 #define _GLIBCXX_MERGESORT

Include parallel multi-way mergesort.

See Also

__gnu_parallel::_Settings::sort_algorithm

Definition at line 41 of file features.h.

5.201.2.6 #define _GLIBCXX_QUICKSORT

Include parallel unbalanced quicksort.

See Also

__gnu_parallel::_Settings::sort_algorithm

Definition at line 48 of file features.h.

5.201.2.7 #define _GLIBCXX_TREE_DYNAMIC_BALANCING

Include the dynamic balancing variant for _Rb_tree::insert_unique(_IIter beg, _IIter __end).

See Also

__gnu_parallel::_Rb_tree

Definition at line 91 of file features.h.

5.201.2.8 #define _GLIBCXX_TREE_FULL_COPY

In order to sort the input sequence of _Rb_tree::insert_unique(_IIter beg, _IIter __end) a full copy of the input elements is done.

See Also

__gnu_parallel::_Rb_tree

Definition at line 100 of file features.h.

5.201.2.9 #define _GLIBCXX_TREE_INITIAL_SPLITTING

Include the initial splitting variant for _Rb_tree::insert_unique(_IIter beg, _IIter __end).

See Also

__gnu_parallel::_Rb_tree

Definition at line 83 of file features.h.

5.203.1 Detailed Description

Parallel implementation base for std::find(), std::equal() and related functions. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file find.h.

5.204 find_fn_imps.hpp File Reference

5.204.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file binary_heap_/find_fn_imps.hpp.

5.205 find_fn_imps.hpp File Reference

5.205.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file binomial_heap_base_/find_fn_imps.hpp.

5.206 find_fn_imps.hpp File Reference

5.206.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file bin_search_tree_/find_fn_imps.hpp.

5.207 find_fn_imps.hpp File Reference

5.207.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions.

Definition in file cc_hash_table_map_/find_fn_imps.hpp.

5.208 find_fn_imps.hpp File Reference

5.208.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions.

Definition in file gp_hash_table_map_/find_fn_imps.hpp.

5.209 find_fn_imps.hpp File Reference

5.209.1 Detailed Description

Contains implementations of lu_map_.

Definition in file list_update_map_/find_fn_imps.hpp.

5.210 find_fn_imps.hpp File Reference

5.210.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file pairing_heap_/find_fn_imps.hpp.

5.211 find_fn_imps.hpp File Reference

5.211.1 Detailed Description

Contains an implementation class for pat_trie.

Definition in file pat_trie_/find_fn_imps.hpp.

5.212 find_fn_imps.hpp File Reference

5.212.1 Detailed Description

Contains an implementation for rb_tree_.

Definition in file rb_tree_map_/find_fn_imps.hpp.

5.213 find_fn_imps.hpp File Reference

5.213.1 Detailed Description

Contains an implementation class for splay_tree_.

Definition in file splay_tree_/find_fn_imps.hpp.

5.214 find_fn_imps.hpp File Reference

5.214.1 Detailed Description

Contains an implementation for thin_heap_.

Definition in file thin_heap_/find_fn_imps.hpp.

5.215 find_no_store_hash_fn_imps.hpp File Reference

5.215.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions, when the hash value is not stored.

Definition in file find_no_store_hash_fn_imps.hpp.

5.216 find_selectors.h File Reference

Classes

- struct __gnu_parallel::__adjacent_find_selector

  Test predicate on two adjacent elements.
- struct __gnu_parallel::__find_first_of_selector< _FIterator >

  Test predicate on several elements.
- struct __gnu_parallel::__find_if_selector

  Test predicate on a single element, used for std::find() and std::find_if ().
- struct __gnu_parallel::__generic_find_selector

  Base class of all __gnu_parallel::__find_template selectors.

- struct __gnu_parallel::__mismatch_selector

  Test inverted predicate on a single element.

Namespaces

- namespace __gnu_parallel

5.216.1 Detailed Description

_Function objects representing different tasks to be plugged into the parallel find algorithm. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file find_selectors.h.

5.217 find_store_hash_fn_imps.hpp File Reference

5.217.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions, when the hash value is stored.

Definition in file cc_hash_table_map_/find_store_hash_fn_imps.hpp.

5.218 find_store_hash_fn_imps.hpp File Reference

5.218.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions, when the hash value is stored.

Definition in file gp_hash_table_map_/find_store_hash_fn_imps.hpp.

5.219 for_each.h File Reference

Namespaces

- namespace __gnu_parallel

Functions

- template<typename _IIter , typename _UserOp , typename _Functionality , typename _Red , typename _Result >
  _UserOp __gnu_parallel::__for_each_template_random_access (_IIter __begin, _IIter __end, _UserOp __user_op, _Functionality &__functionality, _Red __reduction, _Result __reduction_start, _Result &__output, typename std::iterator_traits< _IIter >::difference_type __bound, _Parallelism __parallelism_tag)

5.219.1 Detailed Description

Main interface for embarrassingly parallel functions. The explicit implementation are in other header files, like workstealing.h, par_loop.h, omp_loop.h, and omp_loop_static.h. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file for_each.h.

5.220 for_each_selectors.h File Reference

Classes

- struct __gnu_parallel::__accumulate_binop_reduct< _BinOp >

  General reduction, using a binary operator.
- struct __gnu_parallel::__accumulate_selector< _It >

  std::accumulate() selector.
- struct __gnu_parallel::__adjacent_difference_selector< _It >

  Selector that returns the difference between two adjacent __elements.
- struct __gnu_parallel::__count_if_selector< _It, _Diff >

  std::count_if () selector.
- struct __gnu_parallel::__count_selector< _It, _Diff >

  std::count() selector.
- struct __gnu_parallel::__fill_selector< _It >

  std::fill() selector.
- struct __gnu_parallel::__for_each_selector< _It >

  std::for_each() selector.
- struct __gnu_parallel::__generate_selector< _It >

  std::generate() selector.
- struct __gnu_parallel::__generic_for_each_selector< _It >

  Generic __selector for embarrassingly parallel functions.
- struct __gnu_parallel::__identity_selector< _It >

  Selector that just returns the passed iterator.
- struct __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >

  std::inner_product() selector.
- struct __gnu_parallel::__max_element_reduct< _Compare, _It >

  Reduction for finding the maximum element, using a comparator.
- struct __gnu_parallel::__min_element_reduct< _Compare, _It >

  Reduction for finding the maximum element, using a comparator.
- struct __gnu_parallel::__replace_if_selector< _It, _Op, _Tp >

  std::replace() selector.
- struct __gnu_parallel::__replace_selector< _It, _Tp >

  std::replace() selector.
- struct __gnu_parallel::__transform1_selector< _It >

  std::transform() __selector, one input sequence variant.
- struct __gnu_parallel::__transform2_selector< _It >

  std::transform() __selector, two input sequences variant.
- struct __gnu_parallel::_DummyReduct

  Reduction function doing nothing.
- struct __gnu_parallel::_Nothing

  Functor doing nothing.

Namespaces

- namespace __gnu_parallel

5.220.1 Detailed Description

Functors representing different tasks to be plugged into the generic parallelization methods for embarrassingly parallel functions. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file for_each_selectors.h.

5.224.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file profile/forward_list.

5.225 forward_list.h File Reference

Classes

- struct std::_Fwd_list_base< _Tp, _Alloc >

  Base class for forward_list.

- struct std::_Fwd_list_const_iterator< _Tp >

  A forward_list::const_iterator.
- struct std::_Fwd_list_iterator< _Tp >

  A forward_list::iterator.
- struct std::_Fwd_list_node< _Tp >

  A helper node class for forward_list. This is just a linked list with uninitialized storage for a data value in each node. There is a sorting utility method.
- struct std::_Fwd_list_node_base

  A helper basic node class for forward_list. This is just a linked list with nothing inside it. There are purely list shuffling utility methods here.
- class std::forward_list< _Tp, _Alloc >

  A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Namespaces

- namespace std

Functions

- template<typename _Tp >
  bool std::operator!= (const _Fwd_list_iterator< _Tp > &__x, const _Fwd_list_const_iterator< _Tp > &__y)
- template<typename _Tp , typename _Alloc >
  bool std::operator!= (const forward_list< _Tp, _Alloc > &__lx, const forward_list< _Tp, _Alloc > &__ly)
- template<typename _Tp , typename _Alloc >

5.229.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <exception>.

This header provides support for -fno-exceptions.

Definition in file functexcept.h.

5.230 functional File Reference

Classes

- struct _Bind< _Signature >

  Type of the function object returned from bind().
- struct _Bind_result< _Result, _Signature >

  Type of the function object returned from bind<R>().
- class _Mu< _Arg, _IsBindExp, _IsPlaceholder >
- struct _Reference_wrapper_base_impl< _Unary, _Binary, _Tp >
- struct std::__is_location_invariant< _Tp >
- struct std::_Derives_from_binary_function< _Tp >

  Determines if the type _Tp derives from binary_function.
- struct std::_Derives_from_unary_function< _Tp >

  Determines if the type _Tp derives from unary_function.
- class std::_Function_base

  Base class of all polymorphic function object wrappers.
- struct std::_Maybe_get_result_type< _Has_result_type, _Functor >

  If we have found a result_type, extract it.
- struct std::_Maybe_unary_or_binary_function< _Res, _ArgTypes >
- struct std::_Maybe_unary_or_binary_function< _Res, _T1 >

  Derives from `unary_function`, as appropriate.
- struct std::_Maybe_unary_or_binary_function< _Res, _T1, _T2 >

  Derives from `binary_function`, as appropriate.
- struct std::_Maybe_wrap_member_pointer< _Tp >
- struct std::_Maybe_wrap_member_pointer< _Tp _Class::∗ >
- class std::_Mem_fn< _Res(_Class::∗)(_ArgTypes...) const >

  Implementation of `mem_fn` for const member function pointers.
- class std::_Mem_fn< _Res(_Class::∗)(_ArgTypes...) const volatile >

  Implementation of `mem_fn` for const volatile member function pointers.
- class std::_Mem_fn< _Res(_Class::∗)(_ArgTypes...) volatile >

  Implementation of `mem_fn` for volatile member function pointers.
- class std::_Mem_fn< _Res(_Class::∗)(_ArgTypes...)>

  Implementation of `mem_fn` for member function pointers.
- class std::_Mu< _Arg, false, false >
- class std::_Mu< _Arg, false, true >
- class std::_Mu< _Arg, true, false >
- class std::_Mu< reference_wrapper< _Tp >, false, false >
- struct std::_Placeholder< _Num >

  The type of placeholder objects defined by libstdc++.
- struct std::_Reference_wrapper_base< _Tp >
- struct std::_Safe_tuple_element< __i, _Tuple >
- struct std::_Safe_tuple_element_impl< __i, _Tuple, _IsSafe >
- struct std::_Safe_tuple_element_impl< __i, _Tuple, false >
- struct std::_Weak_result_type< _Functor >
- struct std::_Weak_result_type_impl< _Functor >
- struct std::_Weak_result_type_impl< _Res(&)(_ArgTypes...)>

  Retrieve the result type for a function reference.
- struct std::_Weak_result_type_impl< _Res(∗)(_ArgTypes...)>

Retrieve the result type for a function pointer.

- struct std::_Weak_result_type_impl< _Res(_ArgTypes...)>

  Retrieve the result type for a function type.
- struct std::_Weak_result_type_impl< _Res(_Class::∗)(_ArgTypes...) const >

  Retrieve result type for a const member function pointer.
- struct std::_Weak_result_type_impl< _Res(_Class::∗)(_ArgTypes...) const volatile >

  Retrieve result type for a const volatile member function pointer.
- struct std::_Weak_result_type_impl< _Res(_Class::∗)(_ArgTypes...) volatile >

  Retrieve result type for a volatile member function pointer.
- struct std::_Weak_result_type_impl< _Res(_Class::∗)(_ArgTypes...)>

  Retrieve result type for a member function pointer.
- class std::bad_function_call

  Exception class thrown when class template function's operator() is called with an empty target.
- class std::function< _Res(_ArgTypes...)>

  Primary class template for std::function.
  Polymorphic function wrapper.
- struct std::is_bind_expression< _Tp >

  Determines if the given type _Tp is a function object should be treated as a subexpression when evaluating calls to function objects returned by bind(). [TR1 3.6.1].
- struct std::is_bind_expression< _Bind< _Signature > >

  Class template _Bind is always a bind expression.
- struct std::is_bind_expression< _Bind_result< _Result, _Signature > >

  Class template _Bind_result is always a bind expression.
- struct std::is_bind_expression< const _Bind< _Signature > >

  Class template _Bind is always a bind expression.
- struct std::is_bind_expression< const _Bind_result< _Result, _Signature > >

  Class template _Bind_result is always a bind expression.
- struct std::is_bind_expression< const volatile _Bind< _Signature > >

  Class template _Bind is always a bind expression.
- struct std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > >

  Class template _Bind_result is always a bind expression.
- struct std::is_bind_expression< volatile _Bind< _Signature > >

  Class template _Bind is always a bind expression.
- struct std::is_bind_expression< volatile _Bind_result< _Result, _Signature > >

  Class template _Bind_result is always a bind expression.
- struct std::is_placeholder< _Tp >

  Determines if the given type _Tp is a placeholder in a bind() expression and, if so, which placeholder it is. [TR1 3.6.2].
- struct std::is_placeholder< _Placeholder< _Num > >
- class std::reference_wrapper< _Tp >

  Primary class template for reference_wrapper.

5.235.1 Detailed Description

Contains an implementation class for general probing hash.

Definition in file gp_ht_map_.hpp.

5.236 gslice.h File Reference

Classes

- class std::gslice

  Class defining multi-dimensional subset of an array.

Namespaces

- namespace std

5.236.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <valarray>.

Definition in file gslice.h.

5.237 gslice_array.h File Reference

Classes

- class std::gslice_array< _Tp >

  Reference to multi-dimensional subset of an array.

Namespaces

- namespace std

Macros

- #define **_DEFINE_VALARRAY_OPERATOR**(_Op, _Name)

5.237.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <valarray>.

Definition in file gslice_array.h.

5.238 hash_bytes.h File Reference

Namespaces

- namespace std

Functions

- size_t **std::_Fnv_hash_bytes** (const void ∗__ptr, size_t __len, size_t __seed)
- size_t **std::_Hash_bytes** (const void ∗__ptr, size_t __len, size_t __seed)

5.238.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <functional>.

Definition in file hash_bytes.h.

5.239 hash_eq_fn.hpp File Reference

Classes

- struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >

  Specialization 1 - The client requests that hash values not be stored.
- struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >

  Specialization 2 - The client requests that hash values be stored.
- struct hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >

  Primary template.

Namespaces

- namespace __gnu_pbds

5.239.1 Detailed Description

Contains 2 eqivalence functions, one employing a hash value, and one ignoring it.

Definition in file hash_eq_fn.hpp.

5.240 hash_exponential_size_policy_imp.hpp File Reference

5.240.1 Detailed Description

Contains a resize size policy implementation.

Definition in file hash_exponential_size_policy_imp.hpp.

5.241 hash_fun.h File Reference

Namespaces

- namespace __gnu_cxx

Functions

- size_t **__gnu_cxx::__stl_hash_string** (const char ∗__s)

5.241.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

Definition in file hash_fun.h.

5.242 hash_load_check_resize_trigger_imp.hpp File Reference

Macros

- #define **PB_DS_ASSERT_VALID**(X)
- #define **PB_DS_ASSERT_VALID**(X)

5.242.1 Detailed Description

Contains a resize trigger implementation.

Definition in file hash_load_check_resize_trigger_imp.hpp.

5.243 hash_load_check_resize_trigger_size_base.hpp File Reference

Classes

- class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, true >

  Specializations.
- class hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >

  Primary template.

Namespaces

- namespace __gnu_pbds

5.243.1 Detailed Description

Contains an base holding size for some resize policies.

Definition in file hash_load_check_resize_trigger_size_base.hpp.

5.244 hash_map File Reference

Classes

- class __gnu_cxx::hash_map< _Key, _Tp, _HashFn, _EqualKey, _Alloc >
- class __gnu_cxx::hash_multimap< _Key, _Tp, _HashFn, _EqualKey, _Alloc >

Namespaces

5.244.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

Definition in file hash_map.

5.245 hash_policy.hpp File Reference

Classes

- class __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >

    A resize trigger policy based on collision checks. It keeps the simulated load factor lower than some given load factor.
- class __gnu_pbds::direct_mask_range_hashing< Size_Type >

    A mask range-hashing class (uses a bitmask).
- class __gnu_pbds::direct_mod_range_hashing< Size_Type >

    A mod range-hashing class (uses the modulo function).
- class __gnu_pbds::hash_exponential_size_policy< Size_Type >

    A size policy whose sequence of sizes form an exponential sequence (typically powers of 2.
- class __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >

    A resize trigger policy based on a load check. It keeps the load factor between some load factors load_min and load_max.
- class __gnu_pbds::hash_prime_size_policy

    A size policy whose sequence of sizes form a nearly-exponential sequence of primes.
- class __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >

    A resize policy which delegates operations to size and trigger policies.
- class __gnu_pbds::linear_probe_fn< Size_Type >

    A probe sequence policy using fixed increments.
- class __gnu_pbds::quadratic_probe_fn< Size_Type >

    A probe sequence policy using square increments.

Classes

- struct _Equal_helper< _Key, _Value, _ExtractKey, _Equal, _HashCodeType, __cache_hash_code >
- struct _Equality< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >
- struct _Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __cache_hash_code >
- struct _Hash_node< _Value, _Cache_hash_code >
- struct _Hashtable_ebo_helper< _Nm, _Tp, __use_ebo >
- struct _Insert< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Constant_iterators, _Unique_keys >
- struct _Local_iterator_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __cache_hash_code >
- struct _Rehash_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits >

- struct std::__detail::_Before_begin< _NodeAlloc >
- struct std::__detail::_Default_ranged_hash

  Default ranged hash function H. In principle it should be a function object composed from objects of type H1 and H2 such that h(k, N) = h2(h1(k), N), but that would mean making extra copies of h1 and h2. So instead we'll just use a tag to tell class template hashtable to do that composition.
- struct std::__detail::_Equal_helper< _Key, _Value, _ExtractKey, _Equal, _HashCodeType, false >

  Specialization.
- struct std::__detail::_Equal_helper< _Key, _Value, _ExtractKey, _Equal, _HashCodeType, true >

  Specialization.
- struct std::__detail::_Equality< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, false >

  Specialization.
- struct std::__detail::_Equality< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, true >

  Specialization.
- struct std::__detail::_Equality_base
- struct std::__detail::_Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Default_ranged_hash, false >

  Specialization: hash function and range-hashing function, no caching of hash codes. Provides typedef and accessor required by C++ 11.
- struct std::__detail::_Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Default_ranged_hash, true >

  Specialization: hash function and range-hashing function, caching hash codes. H is provided but ignored. Provides typedef and accessor required by C++ 11.
- struct std::__detail::_Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, false >

  Specialization: ranged hash function, no caching hash codes. H1 and H2 are provided but ignored. We define a dummy hash code type.
- struct std::__detail::_Hash_node< _Value, false >
- struct std::__detail::_Hash_node< _Value, true >
- struct std::__detail::_Hash_node_base
- struct std::__detail::_Hashtable_base< _Key, _Value, _ExtractKey, _Equal, _H1, _H2, _Hash, _Traits >
- struct std::__detail::_Hashtable_ebo_helper< _Nm, _Tp, false >

  Specialization not using EBO.
- struct std::__detail::_Hashtable_ebo_helper< _Nm, _Tp, true >

  Specialization using EBO.
- struct std::__detail::_Hashtable_traits< _Cache_hash_code, _Constant_iterators, _Unique_keys >
- struct std::__detail::_Insert< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, false, _Unique_keys >

  Specialization.
- struct std::__detail::_Insert< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, true, false >

  Specialization.
- struct std::__detail::_Insert< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, true, true >

  Specialization.
- struct std::__detail::_Insert_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits >
- struct std::__detail::_Local_const_iterator< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __constant_iterators, __cache >

  local const_iterators
- struct std::__detail::_Local_iterator< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __constant_iterators, __cache >

local iterators

- struct std::__detail::_Local_iterator_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, false >

    Specialization.
- struct std::__detail::_Local_iterator_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, true >

    Specialization.
- struct std::__detail::_Map_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >
- struct std::__detail::_Map_base< _Key, _Pair, _Alloc, _Select1st, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, false >

    Partial specialization, __unique_keys set to false.
- struct std::__detail::_Map_base< _Key, _Pair, _Alloc, _Select1st, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, true >

    Partial specialization, __unique_keys set to true.
- struct std::__detail::_Mod_range_hashing

    Default range hashing function: use division to fold a large number into the range [0, N).
- struct std::__detail::_Node_const_iterator< _Value, __constant_iterators, __cache >

    Node const_iterators, used to iterate through all the hashtable.
- struct std::__detail::_Node_iterator< _Value, __constant_iterators, __cache >

    Node iterators, used to iterate through all the hashtable.
- struct std::__detail::_Node_iterator_base< _Value, _Cache_hash_code >

    Base class for node iterators.
- struct std::__detail::_Prime_rehash_policy

    Default value for rehash policy. Bucket size is (usually) the smallest prime that keeps the load factor small enough.
- struct std::__detail::_Rehash_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _Prime_rehash_policy, _Traits >

    Specialization.
- class std::_Hashtable< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits >

This is a Standard C++ Library header.

Definition in file iomanip.

5.283 ios File Reference

Macros

- #define **_GLIBCXX_IOS**

5.283.1 Detailed Description

This is a Standard C++ Library header.

Definition in file ios.

5.284 ios_base.h File Reference

Classes

- class std::ios_base

  The base of the I/O class hierarchy.
  This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` *when they need to specify the full name of the various I/O flags (e.g., the openmodes).*
- class std::ios_base::failure

  These are thrown to indicate problems with io.
  27.4.2.1.1 Class ios_base::failure.

Namespaces

5.285.1 Detailed Description

This is a Standard C++ Library header.

Definition in file iosfwd.

5.286 iostream File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_IOSTREAM**

Variables

- static ios_base::Init std::__ioinit

Standard Stream Objects

The <iostream> header declares the eight standard stream objects. For other declarations, see `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch24.html` *and the I/O forward declarations*

They are required by default to cooperate with the global C library's `FILE` *streams, and to be available during program startup and termination. For more information, see the HOWTO linked to above.*

- istream std::cin
- ostream std::cout
- ostream std::cerr
- ostream std::clog
- wistream std::wcin
- wostream std::wcout
- wostream std::wcerr
- wostream std::wclog

5.286.1 Detailed Description

This is a Standard C++ Library header.

Definition in file iostream.

5.310.1 Detailed Description

Contains policies for list update containers.

Definition in file list_update_policy.hpp.

5.311 locale File Reference

Macros

- #define **_GLIBCXX_LOCALE**

5.311.1 Detailed Description

This is a Standard C++ Library header.

Definition in file locale.

5.312 locale_classes.h File Reference

Classes

- class std::collate< _CharT >

  Facet for localized string comparison.
- class std::collate_byname< _CharT >

class collate_byname [22.2.4.2].

- class std::locale

  Container class for localization functionality.
  The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.
- class std::locale::facet

  Localization functionality base class.
  The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.
- class std::locale::id

  Facet ID class.
  The ID class provides facets with an index used to identify them. Every facet class must define a public static member locale::id, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The locale::id ensures that each class type gets a unique identifier.

Classes

- class std::__ctype_abstract_base< _CharT >

  Common base for ctype facet.
- class std::ctype< _CharT >

  Primary class template ctype facet.
  This template class defines classification and conversion functions for character sets. It wraps cctype functionality. Ctype gets used by streams for many I/O operations.
- class std::ctype< char >

  The ctype<char> specialization.
  This class defines classification and conversion functions for the char type. It gets used by char streams for many I/O operations. The char specialization provides a number of optimizations as well.
- class std::ctype< wchar_t >

  The ctype<wchar_t> specialization.
  This class defines classification and conversion functions for the wchar_t type. It gets used by wchar_t streams for many I/O operations. The wchar_t specialization provides a number of optimizations as well.
- class std::ctype_byname< _CharT >

  class ctype_byname [22.2.1.2].
- class std::ctype_byname< char >

  22.2.1.4 Class ctype_byname specializations.
- class std::num_get< _CharT, _InIter >

  Primary class template num_get.
  This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.
- class std::num_put< _CharT, _OutIter >

  Primary class template num_put.
  This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.
- class std::numpunct< _CharT >

  Primary class template numpunct.
  This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.
- class std::numpunct_byname< _CharT >

  class numpunct_byname [22.2.3.2].

Classes

- class std::messages< _CharT >

  Primary class template messages.
  This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.
- struct std::messages_base

  Messages facet base class providing catalog typedef.
- class std::messages_byname< _CharT >

  class messages_byname [22.2.7.2].
- class std::money_base

  Money format ordering data.
  This class contains an ordered array of 4 fields to represent the pattern for formatting a money amount. Each field may contain one entry from the part enum. symbol, sign, and value must be present and the remaining field must contain either none or space.
- class std::money_get< _CharT, _InIter >

  Primary class template money_get.
  This facet encapsulates the code to parse and return a monetary amount from a string.
- class std::money_put< _CharT, _OutIter >

  Primary class template money_put.
  This facet encapsulates the code to format and output a monetary amount.
- class std::moneypunct< _CharT, _Intl >

  Primary class template moneypunct.
  This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.
- class std::moneypunct_byname< _CharT, _Intl >

  class moneypunct_byname [22.2.6.4].

- class std::time_base

  Time format ordering data.
  This class provides an enum representing different orderings of time: day, month, and year.
- class std::time_get< _CharT, _InIter >

  Primary class template time_get.
  This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.
- class std::time_get_byname< _CharT, _InIter >

  class time_get_byname [22.2.5.2].
- class std::time_put< _CharT, _OutIter >

  Primary class template time_put.
  This facet encapsulates the code to format and output dates and times according to formats used by strftime().
- class std::time_put_byname< _CharT, _OutIter >

  class time_put_byname [22.2.5.4].

5.318 localefwd.h File Reference

Classes

- class std::codecvt< _InternT, _ExternT, _StateT >

Primary class template codecvt.
NB: Generic, mostly useless implementation.

- class std::codecvt_byname< _InternT, _ExternT, _StateT >

  class codecvt_byname [22.2.1.6].

- class std::collate< _CharT >

  Facet for localized string comparison.

- class std::collate_byname< _CharT >

  class collate_byname [22.2.4.2].

- class std::ctype< _CharT >

  Primary class template ctype facet.
  This template class defines classification and conversion functions for character sets. It wraps cctype functionality. Ctype gets used by streams for many I/O operations.

- class std::ctype_byname< _CharT >

  class ctype_byname [22.2.1.2].

- class std::messages< _CharT >

  Primary class template messages.
  This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

- class std::messages_byname< _CharT >

  class messages_byname [22.2.7.2].

- class std::money_get< _CharT, _InIter >

  Primary class template money_get.
  This facet encapsulates the code to parse and return a monetary amount from a string.

- class std::money_put< _CharT, _OutIter >

  Primary class template money_put.
  This facet encapsulates the code to format and output a monetary amount.

- class std::moneypunct< _CharT, _Intl >

  Primary class template moneypunct.
  This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

- class std::moneypunct_byname< _CharT, _Intl >

  class moneypunct_byname [22.2.6.4].

- class std::num_get< _CharT, _InIter >

  Primary class template num_get.
  This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

- class std::num_put< _CharT, _OutIter >

  Primary class template num_put.
  This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.

- class std::numpunct< _CharT >

  Primary class template numpunct.
  This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

- class std::numpunct_byname< _CharT >

  class numpunct_byname [22.2.3.2].

- class std::time_get< _CharT, _InIter >

  Primary class template time_get.
  This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

- class std::time_get_byname< _CharT, _InIter >

class time_get_byname [22.2.5.2].

- class std::time_put< _CharT, _OutIter >

  Primary class template time_put.
  This facet encapsulates the code to format and output dates and times according to formats used by strftime().
- class std::time_put_byname< _CharT, _OutIter >

  class time_put_byname [22.2.5.4].

5.318.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

Definition in file localefwd.h.

5.319 losertree.h File Reference

Classes

- class __gnu_parallel::_LoserTree< __stable, _Tp, _Compare >

  Stable _LoserTree variant.
- class __gnu_parallel::_LoserTree< false, _Tp, _Compare >

  Unstable _LoserTree variant.
- class __gnu_parallel::_LoserTreeBase< _Tp, _Compare >

  Guarded loser/tournament tree.
- struct __gnu_parallel::_LoserTreeBase< _Tp, _Compare >::_Loser

  Internal representation of a _LoserTree element.
- class __gnu_parallel::_LoserTreePointer< __stable, _Tp, _Compare >

  Stable _LoserTree implementation.
- class __gnu_parallel::_LoserTreePointer< false, _Tp, _Compare >

  Unstable _LoserTree implementation.
- class __gnu_parallel::_LoserTreePointerBase< _Tp, _Compare >

  Base class of _Loser Tree implementation using pointers.
- struct __gnu_parallel::_LoserTreePointerBase< _Tp, _Compare >::_Loser

  Internal representation of _LoserTree __elements.
- class __gnu_parallel::_LoserTreePointerUnguarded< __stable, _Tp, _Compare >

  Stable unguarded _LoserTree variant storing pointers.
- class __gnu_parallel::_LoserTreePointerUnguarded< false, _Tp, _Compare >

  Unstable unguarded _LoserTree variant storing pointers.
- class __gnu_parallel::_LoserTreePointerUnguardedBase< _Tp, _Compare >

  Unguarded loser tree, keeping only pointers to the elements in the tree structure.
- class __gnu_parallel::_LoserTreeUnguarded< __stable, _Tp, _Compare >

  Stable implementation of unguarded _LoserTree.
- class __gnu_parallel::_LoserTreeUnguarded< false, _Tp, _Compare >

  Non-Stable implementation of unguarded _LoserTree.
- class __gnu_parallel::_LoserTreeUnguardedBase< _Tp, _Compare >

  Base class for unguarded _LoserTree implementation.

Namespaces

- namespace __gnu_parallel

5.319.1 Detailed Description

Many generic loser tree variants. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file losertree.h.

5.320 lu_counter_metadata.hpp File Reference

Classes

- class __gnu_pbds::detail::lu_counter_metadata< Size_Type >

  A list-update metadata type that moves elements to the front of the list based on the counter algorithm.
- class __gnu_pbds::detail::lu_counter_policy_base< Size_Type >

  Base class for list-update counter policy.

Namespaces

- namespace __gnu_pbds

5.320.1 Detailed Description

Contains implementation of a lu counter policy's metadata.

Definition in file lu_counter_metadata.hpp.

5.321 lu_map_.hpp File Reference

Classes

- class __gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >

  list-based (with updates) associative container. Skip to the lu, my darling.

5.322.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file macros.h.

5.322.2 Macro Definition Documentation

5.322.2.1 #define __glibcxx_check_erase(*_Position*)

Verify that we can erase the element referenced by the iterator _Position. We can erase the element if the _Position iterator is dereferenceable and references this sequence.

Definition at line 135 of file macros.h.

5.322.2.2 #define __glibcxx_check_erase_after(*_Position*)

Verify that we can erase the element after the iterator _Position. We can erase the element if the _Position iterator is before a dereferenceable one and references this sequence.

Definition at line 149 of file macros.h.

5.322.2.3 #define __glibcxx_check_erase_range(*_First, _Last*)

Verify that we can erase the elements in the iterator range [_First, _Last). We can erase the elements if [_First, _Last) is a valid iterator range within this sequence.

Definition at line 163 of file macros.h.

5.322.2.4 #define __glibcxx_check_erase_range_after(*_First, _Last*)

Verify that we can erase the elements in the iterator range (_First, _Last). We can erase the elements if (_First, _Last) is a valid iterator range within this sequence.

Definition at line 175 of file macros.h.

5.322.2.5 #define __glibcxx_check_heap_pred(*_First, _Last, _Pred*)

Verify that the iterator range [_First, _Last) is a heap w.r.t. the predicate _Pred.

Definition at line 314 of file macros.h.

5.322.2.6 #define __glibcxx_check_insert(*_Position*)

Verify that we can insert into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_iterator.

Definition at line 73 of file macros.h.

5.322.2.7 #define __glibcxx_check_insert_after(*_Position*)

Verify that we can insert into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_iterator.

Definition at line 90 of file macros.h.

5.322.2.8 #define __glibcxx_check_insert_range(*_Position, _First, _Last*)

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, Last) is a valid (possibly empty) range. Note that this macro is only valid when the container is a _Safe_sequence and the iterator is a _Safe_iterator.

Todo We would like to be able to check for noninterference of _Position and the range [_First, _Last), but that can't (in general) be done.

Definition at line 110 of file macros.h.

5.322.2.9 #define __glibcxx_check_insert_range_after(*_Position,* *_First,* *_Last*)

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, Last) is a valid (possibly empty) range. Note that this macro is only valid when the container is a _Safe_sequence and the iterator is a _Safe_iterator.

Todo We would like to be able to check for noninterference of _Position and the range [_First, _Last), but that can't (in general) be done.

Definition at line 127 of file macros.h.

5.322.2.10 #define __glibcxx_check_partitioned_lower(*_First,* *_Last,* *_Value*)

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value.

Definition at line 262 of file macros.h.

5.322.2.11 #define __glibcxx_check_partitioned_lower_pred(*_First,* *_Last,* *_Value,* *_Pred*)

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.

Definition at line 282 of file macros.h.

5.322.2.12 #define __glibcxx_check_partitioned_upper_pred(*_First,* *_Last,* *_Value,* *_Pred*)

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.

Definition at line 294 of file macros.h.

5.322.2.13 #define __glibcxx_check_sorted_pred(*_First,* *_Last,* *_Pred*)

Verify that the iterator range [_First, _Last) is sorted by the predicate _Pred.

Definition at line 233 of file macros.h.

5.322.2.14 #define _GLIBCXX_DEBUG_VERIFY_AT(*_Condition,* *_ErrorMessage,* *_File,* *_Line*)

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 41 of file macros.h.

5.323 malloc_allocator.h File Reference

Classes

- class __gnu_cxx::malloc_allocator< _Tp >

  An allocator that uses malloc.
  This is precisely the allocator defined in the C++ Standard.

Namespaces

5.336.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <utility>.

Definition in file move.h.

5.337 mt_allocator.h File Reference

Classes

- struct __gnu_cxx::__common_pool_policy< _PoolTp, _Thread >

  Policy for shared __pool objects.
- class __gnu_cxx::__mt_alloc< _Tp, _Poolp >

  This is a fixed size (power of 2) allocator which - when compiled with thread support - will maintain one freelist per size per thread plus a global one. Steps are taken to limit the per thread freelist sizes (by returning excess back to the global list). Further details: `http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt12ch32.html`.
- class __gnu_cxx::__mt_alloc_base< _Tp >

  Base class for _Tp dependent member functions.
- struct __gnu_cxx::__per_type_pool_policy< _Tp, _PoolTp, _Thread >

Policy for individual __pool objects.
- class __gnu_cxx::__pool< false >

  Specialization for single thread.
- class __gnu_cxx::__pool< true >

  Specialization for thread enabled, via gthreads.h.
- struct __gnu_cxx::__pool_base

  Base class for pool object.
- class __pool< _Thread >

  Data describing the underlying memory pool, parameterized on threading support.

Namespaces

- namespace __gnu_cxx

Macros

- #define **__thread_default**

Typedefs

- typedef void(∗ **__gnu_cxx::__destroy_handler**)(void ∗)

Functions

- template<typename _Tp , typename _Poolp >
  bool **__gnu_cxx::operator!=** (const __mt_alloc< _Tp, _Poolp > &, const __mt_alloc< _Tp, _Poolp > &)
- template<typename _Tp , typename _Poolp >
  bool **__gnu_cxx::operator==** (const __mt_alloc< _Tp, _Poolp > &, const __mt_alloc< _Tp, _Poolp > &)

5.337.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file mt_allocator.h.

5.338 multimap.h File Reference

5.343.1 Detailed Description

Implementation of sequential and parallel multiway merge. Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file multiway_merge.h.

5.343.2 Macro Definition Documentation

5.343.2.1 #define _GLIBCXX_PARALLEL_LENGTH(__s)

Length of a sequence described by a pair of iterators.

Definition at line 54 of file multiway_merge.h.

Referenced by __gnu_parallel::__sequential_multiway_merge(), __gnu_parallel::multiway_merge_exact_splitting(), __gnu_parallel::multiway_merge_loser_tree(), __gnu_parallel::multiway_merge_sampling_splitting(), and __gnu_parallel::parallel_multiway_merge().

5.344 multiway_mergesort.h File Reference

Classes

- struct __gnu_parallel::_Piece< _DifferenceTp >

  Subsequence description.
- struct __gnu_parallel::_PMWMSSortingData< _RAIter >

  Data accessed by all threads.
- struct __gnu_parallel::_SplitConsistently< __exact, _RAIter, _Compare, _SortingPlacesIterator >

  Split consistently.
- struct __gnu_parallel::_SplitConsistently< false, _RAIter, _Compare, _SortingPlacesIterator >

  Split by sampling.
- struct __gnu_parallel::_SplitConsistently< true, _RAIter, _Compare, _SortingPlacesIterator >

  Split by exact splitting.

- void ∗ operator new[] (std::size_t, void ∗__p) noexcept
- void operator delete (void ∗, void ∗) noexcept
- void operator delete[] (void ∗, void ∗) noexcept

Variables

- const nothrow_t **std::nothrow**

5.347.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see `http://gcc.gnu.org/onlinedocs/libstdc++/18_support/howto.html#4` for more.

Definition in file new.

5.347.2 Function Documentation

5.347.2.1 void operator delete (void ∗) [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.2 void operator delete (void *, const std::nothrow_t &) `[noexcept]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.3 void operator delete (void *, void *) `[inline]`, `[noexcept]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 115 of file new.

5.347.2.4 void operator delete[] (void *) `[noexcept]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.5 void operator delete[] (void *, const std::nothrow_t &) `[noexcept]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.6 void operator delete[] (void *, void *) [inline], [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 116 of file new.

5.347.2.7 void* operator new (std::size_t)

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.8 void* operator new (std::size_t, const std::nothrow_t &) [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.9 void* operator new (std::size_t, void * __p) [inline], [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 109 of file new.

5.347.2.10 void∗ operator new[] (std::size_t)

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.11 void∗ operator new[] (std::size_t , const std::nothrow_t &) `[noexcept]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.347.2.12 void∗ operator new[] (std::size_t , void ∗ *__p*) `[inline]`, `[noexcept]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 111 of file new.

5.348 new_allocator.h File Reference

Classes

- class __gnu_cxx::new_allocator< _Tp >

  An allocator that uses global new, as per [20.4].
  This is precisely the allocator defined in the C++ Standard.

Namespaces

- namespace __gnu_cxx

Functions

- template<typename _Tp >
  bool **__gnu_cxx::operator!=** (const new_allocator< _Tp > &, const new_allocator< _Tp > &)
- template<typename _Tp >
  bool **__gnu_cxx::operator==** (const new_allocator< _Tp > &, const new_allocator< _Tp > &)

5.348.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file new_allocator.h.

5.349 node.hpp File Reference

Classes

- struct __gnu_pbds::detail::left_child_next_sibling_heap_node_< _Value, _Metadata, _Alloc >

  Node.

Namespaces

- namespace __gnu_pbds

5.349.1 Detailed Description

Contains an implementation struct for this type of heap's node.

Definition in file left_child_next_sibling_heap_/node.hpp.

5.350 node.hpp File Reference

Classes

- struct __gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >

  Node for Red-Black trees.

Namespaces

- namespace __gnu_pbds

5.350.1 Detailed Description

Contains an implementation for rb_tree_.

Definition in file rb_tree_map_/node.hpp.

5.351 node.hpp File Reference

Classes

- struct __gnu_pbds::detail::splay_tree_node_< Value_Type, Metadata, _Alloc >

  Node for splay tree.

Namespaces

5.359.1 Detailed Description

Parallel STL function calls corresponding to stl_numeric.h. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file parallel/numeric.

- #define **PB_DS_PAT_TRIE_TRAITS_BASE**
- #define **PB_DS_RECURSIVE_COUNT_LEAFS**(X)

5.377.1 Detailed Description

Contains an implementation class for a patricia tree.

Definition in file pat_trie_.hpp.

5.378 pat_trie_base.hpp File Reference

Classes

- struct __gnu_pbds::detail::pat_trie_base

  Base type for PATRICIA trees.

- class __gnu_pbds::detail::pat_trie_base::_CIter< Node, Leaf, Head, Inode, Is_Forward_Iterator >

  Const iterator.
- struct __gnu_pbds::detail::pat_trie_base::_Head< _ATraits, Metadata >

  Head node for PATRICIA tree.
- struct __gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >

  Internal node type, PATRICIA tree.
- struct __gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >::const_iterator

  Constant child iterator.
- struct __gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >::iterator

  Child iterator.
- class __gnu_pbds::detail::pat_trie_base::_Iter< Node, Leaf, Head, Inode, Is_Forward_Iterator >

  Iterator.
- struct __gnu_pbds::detail::pat_trie_base::_Leaf< _ATraits, Metadata >

  Leaf node for PATRICIA tree.
- struct __gnu_pbds::detail::pat_trie_base::_Metadata< Metadata, _Alloc >

  Metadata base primary template.
- struct __gnu_pbds::detail::pat_trie_base::_Metadata< null_type, _Alloc >

  Specialization for null metadata.
- struct __gnu_pbds::detail::pat_trie_base::_Node_base< _ATraits, Metadata >

  Node base.
- class __gnu_pbds::detail::pat_trie_base::_Node_citer< Node, Leaf, Head, Inode, _CIterator, Iterator, _Alloc >

  Node const iterator.
- class __gnu_pbds::detail::pat_trie_base::_Node_iter< Node, Leaf, Head, Inode, _CIterator, Iterator, _Alloc >

  Node iterator.

Namespaces

5.378.1 Detailed Description

Contains the base class for a patricia tree.

Definition in file pat_trie_base.hpp.

5.379 pod_char_traits.h File Reference

Classes

- struct __gnu_cxx::character< V, I, S >

  A POD class that serves as a character abstraction class.
- struct std::char_traits< __gnu_cxx::character< V, I, S > >

  char_traits<__gnu_cxx::character> specialization.

Namespaces

- namespace __gnu_cxx
- namespace std

Functions

- template<typename V , typename I , typename S >
  bool **__gnu_cxx::operator<** (const character< V, I, S > &lhs, const character< V, I, S > &rhs)
- template<typename V , typename I , typename S >
  bool **__gnu_cxx::operator==** (const character< V, I, S > &lhs, const character< V, I, S > &rhs)

5.379.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file pod_char_traits.h.

5.380 point_const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::binary_heap_point_const_iterator_< Value_Type, Entry, Simple, _Alloc >

  Const point-type iterator.

Namespaces

- namespace __gnu_pbds

5.380.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

Definition in file binary_heap_/point_const_iterator.hpp.

5.381 point_const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >

  Const point-type iterator.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

5.381.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

Definition in file left_child_next_sibling_heap_/point_const_iterator.hpp.

5.382 point_const_iterator.hpp File Reference

Classes

- class point_const_iterator_

  Const point-type iterator.

5.382.1 Detailed Description

Contains an iterator class returned by the tables' const find and insert methods.

Definition in file unordered_iterator/point_const_iterator.hpp.

5.383 point_iterator.hpp File Reference

Classes

- class point_iterator_

  Find type iterator.

5.383.1 Detailed Description

Contains an iterator class returned by the tables' find and insert methods.

Definition in file point_iterator.hpp.

5.384 point_iterators.hpp File Reference

Classes

- class __gnu_pbds::detail::bin_search_tree_const_it_< Node_Pointer, Value_Type, Pointer, Const_Pointer, Reference, Const_Reference, Is_Forward_Iterator, _Alloc >

  Const iterator.

- class __gnu_pbds::detail::bin_search_tree_it_< Node_Pointer, Value_Type, Pointer, Const_Pointer, Reference, Const_Reference, Is_Forward_Iterator, _Alloc >

  Iterator.

Namespaces

- namespace __gnu_pbds

5.384.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file point_iterators.hpp.

5.385 pointer.h File Reference

Classes

- struct __gnu_cxx::_Invalid_type
- class __gnu_cxx::_Pointer_adapter< _Storage_policy >
- class __gnu_cxx::_Relative_pointer_impl< _Tp >

  A storage policy for use with _Pointer_adapter<> which stores the pointer's address as an offset value which is relative to its own address.
- class __gnu_cxx::_Relative_pointer_impl< const _Tp >
- class __gnu_cxx::_Std_pointer_impl< _Tp >

  A storage policy for use with _Pointer_adapter<> which yields a standard pointer.
- struct __gnu_cxx::_Unqualified_type< _Tp >

Namespaces

5.385.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

Provides reusable _Pointer_adapter for assisting in the development of custom pointer types that can be used with the standard containers via the allocator::pointer and allocator::const_pointer typedefs.

Definition in file pointer.h.

5.386 policy_access_fn_imps.hpp File Reference

5.386.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file binary_heap_/policy_access_fn_imps.hpp.

5.387 policy_access_fn_imps.hpp File Reference

5.387.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file bin_search_tree_/policy_access_fn_imps.hpp.

5.388 policy_access_fn_imps.hpp File Reference

5.388.1 Detailed Description

Contains implementations of cc_ht_map_'s policy access functions.

Definition in file cc_hash_table_map_/policy_access_fn_imps.hpp.

5.389 policy_access_fn_imps.hpp File Reference

5.389.1 Detailed Description

Contains implementations of gp_ht_map_'s policy agpess functions.

Definition in file gp_hash_table_map_/policy_access_fn_imps.hpp.

5.390 policy_access_fn_imps.hpp File Reference

5.390.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

Definition in file left_child_next_sibling_heap_/policy_access_fn_imps.hpp.

5.391 policy_access_fn_imps.hpp File Reference

5.391.1 Detailed Description

Contains an implementation class for ov_tree.

Definition in file ov_tree_map_/policy_access_fn_imps.hpp.

5.392 policy_access_fn_imps.hpp File Reference

5.392.1 Detailed Description

Contains an implementation class for pat_trie.

Definition in file pat_trie_/policy_access_fn_imps.hpp.

5.393 pool_allocator.h File Reference

Classes

- class __gnu_cxx::__pool_alloc< _Tp >

  Allocator using a memory pool with a single lock.
- class __gnu_cxx::__pool_alloc_base

  Base class for __pool_alloc.

Namespaces

- namespace __gnu_cxx

Functions

- template<typename _Tp >
  bool **__gnu_cxx::operator!=** (const __pool_alloc< _Tp > &, const __pool_alloc< _Tp > &)
- template<typename _Tp >
  bool **__gnu_cxx::operator==** (const __pool_alloc< _Tp > &, const __pool_alloc< _Tp > &)

5.393.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file pool_allocator.h.

5.394 postypes.h File Reference

Classes

- class std::fpos< _StateT >

  Class representing stream positions.

Namespaces

- namespace std

Typedefs

- typedef long long std::streamoff
- typedef fpos< mbstate_t > std::streampos
- typedef ptrdiff_t std::streamsize
- typedef fpos< mbstate_t > std::u16streampos
- typedef fpos< mbstate_t > std::u32streampos
- typedef fpos< mbstate_t > std::wstreampos

Functions

- template<typename _StateT >
  bool **std::operator!=** (const fpos< _StateT > &__lhs, const fpos< _StateT > &__rhs)
- template<typename _StateT >
  bool std::operator== (const fpos< _StateT > &__lhs, const fpos< _StateT > &__rhs)

5.394.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iosfwd>.

Definition in file postypes.h.

5.395 prefix_search_node_update_imp.hpp File Reference

5.395.1 Detailed Description

Contains an implementation of prefix_search_node_update.

Definition in file prefix_search_node_update_imp.hpp.

5.396 priority_queue.hpp File Reference

Classes

- class __gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >

Namespaces

- namespace __gnu_pbds

5.396.1 Detailed Description

Contains priority_queues.

Definition in file priority_queue.hpp.

5.397 priority_queue_base_dispatch.hpp File Reference

Classes

- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type >

  Specialization for binary_heap.
- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, binomial_heap_tag, null_type >

  Specialization for binomial_heap.
- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, pairing_heap_tag, null_type >

  Specialization for pairing_heap.
- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, rc_binomial_heap_tag, null_type >

  Specialization for rc_binary_heap.
- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, thin_heap_tag, null_type >

  Specialization for thin_heap.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_ASSERT_VALID**(X)
- #define **PB_DS_DEBUG_VERIFY**(_Cond)

5.397.1 Detailed Description

Contains an pqiative container dispatching base.

Definition in file priority_queue_base_dispatch.hpp.

5.398 probe_fn_base.hpp File Reference

Classes

- class __gnu_pbds::detail::probe_fn_base< _Alloc >

  Probe functor base.

Namespaces

- namespace __gnu_pbds

5.398.1 Detailed Description

Contains a probe policy base.

Definition in file probe_fn_base.hpp.

5.399 profiler.h File Reference

Classes

- struct __gnu_profile::__reentrance_guard

  Reentrance guard.

Namespaces

5.399.1 Detailed Description

Interface of the profiling runtime library.

Definition in file profiler.h.

5.400 profiler_algos.h File Reference

Namespaces

- namespace __gnu_profile

Functions

- template<typename _InputIterator , typename _Function >
  _Function **__gnu_profile::__for_each** (_InputIterator __first, _InputIterator __last, _Function __f)
- template<typename _Container >
  void **__gnu_profile::__insert_top_n** (_Container &__output, const typename _Container::value_type &__value, typename _Container::size_type __n)
- template<typename _ForwardIterator , typename _Tp >
  _ForwardIterator **__gnu_profile::__remove** (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__value)

- template<typename _Container >
  void **__gnu_profile::__top_n** (const _Container &__input, _Container &__output, typename _Container::size_type __n)

5.400.1 Detailed Description

Algorithms used by the profile extension. This file is needed to avoid including <algorithm> or <bits/stl_algo.h>. Including those files would result in recursive includes. These implementations are oversimplified. In general, efficiency may be sacrificed to minimize maintenance overhead.

Definition in file profiler_algos.h.

5.401 profiler_container_size.h File Reference

Classes

- class __gnu_profile::__container_size_info
  A container size instrumentation line in the object table.
- class __gnu_profile::__container_size_stack_info
  A container size instrumentation line in the stack table.
- class __gnu_profile::__trace_container_size
  Container size instrumentation trace producer.

Namespaces

- namespace __gnu_profile

5.401.1 Detailed Description

Diagnostics for container sizes.

Definition in file profiler_container_size.h.

5.402 profiler_hash_func.h File Reference

Classes

- class __gnu_profile::__hashfunc_info
  A hash performance instrumentation line in the object table.
- class __gnu_profile::__hashfunc_stack_info
  A hash performance instrumentation line in the stack table.
- class __gnu_profile::__trace_hash_func
  Hash performance instrumentation producer.

Namespaces

5.409.1 Detailed Description

Data structures to represent profiling traces.

Definition in file profiler_trace.h.

5.410 profiler_vector_size.h File Reference

Classes

- class __gnu_profile::__trace_vector_size

  Hashtable size instrumentation trace producer.

Namespaces

- namespace __gnu_profile

Functions

- void **__gnu_profile::__trace_vector_size_construct** (const void ∗, std::size_t)
- void **__gnu_profile::__trace_vector_size_destruct** (const void ∗, std::size_t, std::size_t)
- void **__gnu_profile::__trace_vector_size_init** ()
- void **__gnu_profile::__trace_vector_size_report** (FILE ∗, __warning_vector_t &)
- void **__gnu_profile::__trace_vector_size_resize** (const void ∗, std::size_t, std::size_t)

5.410.1 Detailed Description

Collection of vector size traces.

Definition in file profiler_vector_size.h.

5.411 profiler_vector_to_list.h File Reference

Classes

- class __gnu_profile::__trace_vector_to_list

  Vector-to-list instrumentation producer.
- class __gnu_profile::__vector2list_info

  A vector-to-list instrumentation line in the object table.
- class __gnu_profile::__vector2list_stack_info

  A vector-to-list instrumentation line in the stack table.

Namespaces

- namespace __gnu_profile

Functions

- void **__gnu_profile::__trace_vector_to_list_construct** (const void ∗)
- void **__gnu_profile::__trace_vector_to_list_destruct** (const void ∗)
- void **__gnu_profile::__trace_vector_to_list_find** (const void ∗, std::size_t)
- void **__gnu_profile::__trace_vector_to_list_init** ()

- void **__gnu_profile::__trace_vector_to_list_report** (FILE ∗, __warning_vector_t &)
- void **__gnu_profile::__trace_vector_to_list_resize** (const void ∗, std::size_t, std::size_t)

5.411.1 Detailed Description

diagnostics for vector to list.

Definition in file profiler_vector_to_list.h.

5.412 ptr_traits.h File Reference

Classes

- struct std::pointer_traits< _Ptr >

  Uniform interface to all pointer-like types.
- struct std::pointer_traits< _Tp ∗ >

  Partial specialization for built-in pointers.

Namespaces

- namespace std

5.412.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <memory>.

Definition in file ptr_traits.h.

5.413 quadratic_probe_fn_imp.hpp File Reference

5.413.1 Detailed Description

Contains a probe policy implementation

Definition in file quadratic_probe_fn_imp.hpp.

5.414 queue File Reference

Macros

- #define **_GLIBCXX_QUEUE**

5.414.1 Detailed Description

This is a Standard C++ Library header.

Definition in file queue.

5.415 queue.h File Reference

Classes

- class __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >

  Double-ended queue of bounded size, allowing lock-free atomic access. push_front() and pop_front() must not be called concurrently to each other, while pop_back() can be called concurrently at all times. `empty()`, `size()`, *and* `top()` *are intentionally not provided. Calling them would not make sense in a concurrent setting.*

Namespaces

- namespace __gnu_parallel

Macros

- #define _GLIBCXX_VOLATILE

5.415.1 Detailed Description

Lock-free double-ended queue. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file queue.h.

5.415.2 Macro Definition Documentation

5.415.2.1 #define _GLIBCXX_VOLATILE

Decide whether to declare certain variable volatile in this file.

Definition at line 40 of file queue.h.

5.416 quicksort.h File Reference

Namespaces

- namespace __gnu_parallel

Functions

- template<typename _RAIter , typename _Compare >
  void __gnu_parallel::__parallel_sort_qs (_RAIter __begin, _RAIter __end, _Compare __comp, _ThreadIndex __num_threads)
- template<typename _RAIter , typename _Compare >
  void __gnu_parallel::__parallel_sort_qs_conquer (_RAIter __begin, _RAIter __end, _Compare __comp, _ThreadIndex __num_threads)

- template<typename _RAIter , typename _Compare >
  std::iterator_traits< _RAIter >
  ::difference_type __gnu_parallel::__parallel_sort_qs_divide (_RAIter __begin, _RAIter __end, _Compare __comp, typename std::iterator_traits< _RAIter >::difference_type __pivot_rank, typename std::iterator_traits< _RAIter >::difference_type __num_samples, _ThreadIndex __num_threads)

5.416.1 Detailed Description

Implementation of a unbalanced parallel quicksort (in-place). This file is a GNU parallel extension to the Standard C++ Library.

Definition in file quicksort.h.

5.417 r_erase_fn_imps.hpp File Reference

5.417.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file bin_search_tree_/r_erase_fn_imps.hpp.

5.418 r_erase_fn_imps.hpp File Reference

5.418.1 Detailed Description

Contains an implementation class for pat_trie.

Definition in file pat_trie_/r_erase_fn_imps.hpp.

5.419 random File Reference

Macros

- #define **_GLIBCXX_RANDOM**

5.419.1 Detailed Description

This is a Standard C++ Library header.

Definition in file random.

5.420 random.h File Reference

Classes

- class std::bernoulli_distribution

  A Bernoulli random number distribution.
- struct std::bernoulli_distribution::param_type
- class std::binomial_distribution< _IntType >

  A discrete binomial random number distribution.

- struct std::binomial_distribution< _IntType >::param_type
- class std::cauchy_distribution< _RealType >

  A cauchy_distribution random number distribution.
- struct std::cauchy_distribution< _RealType >::param_type
- class std::chi_squared_distribution< _RealType >

  A chi_squared_distribution random number distribution.
- struct std::chi_squared_distribution< _RealType >::param_type
- class std::discard_block_engine< _RandomNumberEngine, __p, __r >
- class std::discrete_distribution< _IntType >

  A discrete_distribution random number distribution.
- struct std::discrete_distribution< _IntType >::param_type
- class std::exponential_distribution< _RealType >

  An exponential continuous distribution for random numbers.
- struct std::exponential_distribution< _RealType >::param_type
- class std::extreme_value_distribution< _RealType >

  A extreme_value_distribution random number distribution.
- struct std::extreme_value_distribution< _RealType >::param_type
- class std::fisher_f_distribution< _RealType >

  A fisher_f_distribution random number distribution.
- struct std::fisher_f_distribution< _RealType >::param_type
- class std::gamma_distribution< _RealType >

  A gamma continuous distribution for random numbers.
- struct std::gamma_distribution< _RealType >::param_type
- class std::geometric_distribution< _IntType >

  A discrete geometric random number distribution.
- struct std::geometric_distribution< _IntType >::param_type
- class std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >
- class std::linear_congruential_engine< _UIntType, __a, __c, __m >

  A model of a linear congruential random number generator.
- class std::lognormal_distribution< _RealType >

  A lognormal_distribution random number distribution.
- struct std::lognormal_distribution< _RealType >::param_type
- class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >
- class std::negative_binomial_distribution< _IntType >

  A negative_binomial_distribution random number distribution.
- struct std::negative_binomial_distribution< _IntType >::param_type
- class std::normal_distribution< _RealType >

  A normal continuous distribution for random numbers.
- struct std::normal_distribution< _RealType >::param_type
- class std::piecewise_constant_distribution< _RealType >

  A piecewise_constant_distribution random number distribution.
- struct std::piecewise_constant_distribution< _RealType >::param_type
- class std::piecewise_linear_distribution< _RealType >

  A piecewise_linear_distribution random number distribution.
- struct std::piecewise_linear_distribution< _RealType >::param_type
- class std::poisson_distribution< _IntType >

  A discrete Poisson random number distribution.

- struct std::poisson_distribution< _IntType >::param_type
- class std::random_device
- class std::seed_seq

  The seed_seq class generates sequences of seeds for random number generators.
- class std::shuffle_order_engine< _RandomNumberEngine, __k >

  Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits __w.
- class std::student_t_distribution< _RealType >

  A student_t_distribution random number distribution.
- struct std::student_t_distribution< _RealType >::param_type
- class std::uniform_int_distribution< _IntType >

  Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.
- struct std::uniform_int_distribution< _IntType >::param_type
- class std::uniform_real_distribution< _RealType >

  Uniform continuous distribution for random numbers.
- struct std::uniform_real_distribution< _RealType >::param_type
- class std::weibull_distribution< _RealType >

  A weibull_distribution random number distribution.
- struct std::weibull_distribution< _RealType >::param_type

Namespaces

- namespace std
- namespace std::__detail

5.422.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ext/random>.

Definition in file ext/random.tcc.

5.423 random_number.h File Reference

Classes

- class __gnu_parallel::_RandomNumber

  Random number generator, based on the Mersenne twister.

Namespaces

- namespace __gnu_parallel

5.423.1 Detailed Description

Random number generator based on the Mersenne twister. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file random_number.h.

5.424 random_shuffle.h File Reference

Classes

- struct __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >

  Data known to every thread participating in __gnu_parallel::__parallel_random_shuffle().
- struct __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >

  Local data for a thread participating in __gnu_parallel::__parallel_random_shuffle().

Namespaces

- namespace __gnu_parallel

Typedefs

- typedef unsigned short __gnu_parallel::_BinIndex

Functions

- template<typename _RAIter , typename _RandomNumberGenerator >
  void __gnu_parallel::__parallel_random_shuffle (_RAIter __begin, _RAIter __end, _RandomNumberGenerator __rng=_RandomNumber())
- template<typename _RAIter , typename _RandomNumberGenerator >

  using std::ratio_multiply = typename __ratio_multiply< _R1, _R2 >::type

5.428.1 Detailed Description

This is a Standard C++ Library header.

Definition in file ratio.

5.429 ratio File Reference

Namespaces

- namespace std
- namespace std::tr2

5.429.1 Detailed Description

This is a TR2 C++ Library header.

Definition in file tr2/ratio.

5.430 rb_tree File Reference

Classes

- struct __gnu_cxx::rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc >

Namespaces

- namespace __gnu_cxx

Macros

- #define **_RB_TREE**

5.430.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

Definition in file rb_tree.

5.431 rb_tree_.hpp File Reference

Classes

- class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

  Red-Black tree.
  This implementation uses an idea from the SGI STL (using a header node which is needed for efficient iteration).

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_RB_TREE_BASE**
- #define **PB_DS_RB_TREE_BASE_NAME**
- #define **PB_DS_RB_TREE_NAME**
- #define **PB_DS_STRUCT_ONLY_ASSERT_VALID**(X)

5.431.1 Detailed Description

Contains an implementation for Red Black trees.

Definition in file rb_tree_.hpp.

5.432 rc.hpp File Reference

Classes

- class __gnu_pbds::detail::rc< _Node, _Alloc >

  Redundant binary counter.

Namespaces

- namespace __gnu_pbds

5.432.1 Detailed Description

Contains a redundant (binary counter).

Definition in file rc.hpp.

5.433 rc_binomial_heap_.hpp File Reference

Classes

- class __gnu_pbds::detail::rc_binomial_heap< Value_Type, Cmp_Fn, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_RC_C_DEC**

5.433.1 Detailed Description

Contains an implementation for redundant-counter binomial heap.

Definition in file rc_binomial_heap_.hpp.

5.434 rc_string_base.h File Reference

Classes

- class __gnu_cxx::__rc_string_base< _CharT, _Traits, _Alloc >

Namespaces

- namespace __gnu_cxx

5.434.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ext/vstring.h>.

Definition in file rc_string_base.h.

5.435 regex File Reference

Macros

- #define **_GLIBCXX_REGEX**

5.435.1 Detailed Description

This is a Standard C++ Library header.

Definition in file regex.

5.436 regex.h File Reference

Classes

- class std::basic_regex< _Ch_type, _Rx_traits >

- class std::match_results< _Bi_iter, _Alloc >

  The results of a match or search operation.
- class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
- class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
- struct std::regex_traits< _Ch_type >

  Class regex_traits. Describes aspects of a regular expression.
- class std::sub_match< _BiIter >

Namespaces

- namespace std

Typedefs

- template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >

5.438.1 Detailed Description

Constant definitions for the std regex library. This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

Definition in file regex_constants.h.

5.439 regex_cursor.h File Reference

Classes

- struct std::__detail::_PatternCursor

  ABC for pattern matching.
- class std::__detail::_SpecializedCursor< _FwdIterT >

  Provides a cursor into the specific target string.

Namespaces

- namespace std
- namespace std::__detail

Functions

- template<typename _FwdIterT >
  _SpecializedCursor< _FwdIterT > **std::__detail::__cursor** (const _FwdIterT &__b, const _FwdIterT __e)

5.439.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

Definition in file regex_cursor.h.

5.440 regex_error.h File Reference

Classes

- class std::regex_error

  A regular expression exception class.
  The regular expression library throws objects of this class on error.

Namespaces

- namespace std
- namespace std::regex_constants

Functions

- void **std::__throw_regex_error** (regex_constants::error_type __ecode)

5.3 Error Types

- enum std::regex_constants::error_type {
  _S_error_collate, **_S_error_ctype**, **_S_error_escape**, **_S_error_backref**,
  _S_error_brack, **_S_error_paren**, **_S_error_brace**, **_S_error_badbrace**,
  _S_error_range, **_S_error_space**, **_S_error_badrepeat**, **_S_error_complexity**,
  _S_error_stack, **_S_error_last** }
- constexpr error_type std::regex_constants::error_collate (_S_error_collate)
- constexpr error_type std::regex_constants::error_ctype (_S_error_ctype)
- constexpr error_type std::regex_constants::error_escape (_S_error_escape)
- constexpr error_type std::regex_constants::error_backref (_S_error_backref)
- constexpr error_type std::regex_constants::error_brack (_S_error_brack)
- constexpr error_type std::regex_constants::error_paren (_S_error_paren)
- constexpr error_type std::regex_constants::error_brace (_S_error_brace)
- constexpr error_type std::regex_constants::error_badbrace (_S_error_badbrace)
- constexpr error_type std::regex_constants::error_range (_S_error_range)
- constexpr error_type std::regex_constants::error_space (_S_error_space)
- constexpr error_type std::regex_constants::error_badrepeat (_S_error_badrepeat)
- constexpr error_type std::regex_constants::error_complexity (_S_error_complexity)
- constexpr error_type std::regex_constants::error_stack (_S_error_stack)

5.440.1 Detailed Description

Error and exception objects for the std regex library. This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

Definition in file regex_error.h.

5.441 regex_grep_matcher.h File Reference

Classes

- class std::__detail::_Grep_matcher

  Executes a regular expression NFA/DFA over a range using a variant of the parallel execution algorithm featured in the grep utility, modified to use Laurikari tags.
- class std::__detail::_SpecializedResults< _FwdIterT, _Alloc >

  A _Results facade specialized for wrapping a templated match_results.
- class std::match_results< _Bi_iter, _Alloc >

  The results of a match or search operation.
- class std::sub_match< _BiIter >

Namespaces

- namespace std
- namespace std::__detail

Typedefs

- typedef std::stack< _StateIdT,
  std::vector< _StateIdT > > std::__detail::_StateStack

5.441.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

Definition in file regex_grep_matcher.h.

5.442 regex_grep_matcher.tcc File Reference

Namespaces

- namespace std
- namespace std::__detail

5.442.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

Definition in file regex_grep_matcher.tcc.

5.443 regex_nfa.h File Reference

Classes

- class std::__detail::_Automaton

Base class for, um, automata. Could be an NFA or a DFA. Your choice.

- struct std::__detail::_CharMatcher< _InIterT, _TraitsT >

  Matches a single character.
- struct std::__detail::_EndTagger< _FwdIterT, _TraitsT >

  End state tag.
- class std::__detail::_Nfa

  struct _Nfa
- struct std::__detail::_RangeMatcher< _InIterT, _TraitsT >

  Matches a character range (bracket expression)
- struct std::__detail::_Results

  Provides a generic facade for a templated match_results.
- struct std::__detail::_StartTagger< _FwdIterT, _TraitsT >

  Start state tag.
- struct std::__detail::_State

  struct _State
- class std::__detail::_StateSeq

  Describes a sequence of one or more _State, its current start and end(s). This structure contains fragments of an NFA during construction.

Namespaces

- namespace std
- namespace std::__detail

Typedefs

- typedef std::shared_ptr < _Automaton > std::__detail::_AutomatonPtr
- typedef std::function< bool(const _PatternCursor &)> std::__detail::_Matcher
- typedef int std::__detail::_StateIdT
- typedef std::set< _StateIdT > std::__detail::_StateSet
- typedef std::function< void(const _PatternCursor &, _Results &)> std::__detail::_Tagger

Enumerations

- enum std::__detail::_Opcode { **_S_opcode_unknown**, **_S_opcode_alternative**, **_S_opcode_subexpr_begin**, **_S_opcode_subexpr_end**, **_S_opcode_match**, **_S_opcode_accept** }

Functions

- bool std::__detail::_AnyMatcher (const _PatternCursor &)

Variables

- static const _StateIdT std::__detail::_S_invalid_state_id

5.443.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

Definition in file regex_nfa.h.

5.444 regex_nfa.tcc File Reference

Namespaces

- namespace std
- namespace std::__detail

5.444.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

Definition in file regex_nfa.tcc.

5.445 resize_fn_imps.hpp File Reference

5.445.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions.

Definition in file cc_hash_table_map_/resize_fn_imps.hpp.

5.446 resize_fn_imps.hpp File Reference

5.446.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions.

Definition in file gp_hash_table_map_/resize_fn_imps.hpp.

5.447 resize_no_store_hash_fn_imps.hpp File Reference

5.447.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions, when the hash value is not stored.

Definition in file cc_hash_table_map_/resize_no_store_hash_fn_imps.hpp.

5.448 resize_no_store_hash_fn_imps.hpp File Reference

5.448.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions, when the hash value is not stored.

Definition in file gp_hash_table_map_/resize_no_store_hash_fn_imps.hpp.

5.449 resize_policy.hpp File Reference

Classes

- class __gnu_pbds::detail::resize_policy< _Tp >

  Resize policy for binary heap.

Namespaces

- namespace __gnu_pbds

5.449.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file resize_policy.hpp.

5.450 resize_store_hash_fn_imps.hpp File Reference

5.450.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions, when the hash value is stored.

Definition in file cc_hash_table_map_/resize_store_hash_fn_imps.hpp.

5.451 resize_store_hash_fn_imps.hpp File Reference

5.451.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions, when the hash value is stored.

Definition in file gp_hash_table_map_/resize_store_hash_fn_imps.hpp.

5.469.1 Detailed Description

Contains a ranged probe policy.

Definition in file sample_ranged_probe_fn.hpp.

5.470 sample_resize_policy.hpp File Reference

Classes

- class __gnu_pbds::sample_resize_policy

  A sample resize policy.

Namespaces

- namespace __gnu_pbds

5.470.1 Detailed Description

Contains a sample resize policy for hash tables.

Definition in file sample_resize_policy.hpp.

5.471 sample_resize_trigger.hpp File Reference

Classes

- class __gnu_pbds::sample_resize_trigger

  A sample resize trigger policy.

Namespaces

- namespace __gnu_pbds

5.471.1 Detailed Description

Contains a sample resize trigger policy class.

Definition in file sample_resize_trigger.hpp.

5.472 sample_size_policy.hpp File Reference

Classes

- class __gnu_pbds::sample_size_policy

  A sample size policy.

Namespaces

- namespace __gnu_pbds

5.472.1 Detailed Description

Contains a sample size resize-policy.

Definition in file sample_size_policy.hpp.

5.473 sample_tree_node_update.hpp File Reference

Classes

- class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >

  A sample node updator.

Namespaces

- namespace __gnu_pbds

5.473.1 Detailed Description

Contains a samle node update functor.

Definition in file sample_tree_node_update.hpp.

5.474 sample_trie_access_traits.hpp File Reference

Classes

- struct __gnu_pbds::sample_trie_access_traits

  A sample trie element access traits.

Namespaces

- namespace __gnu_pbds

5.474.1 Detailed Description

Contains a sample probe policy.

Definition in file sample_trie_access_traits.hpp.

5.475 sample_trie_node_update.hpp File Reference

Classes

- class __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

  A sample node updator.

Namespaces

- namespace __gnu_pbds

5.475.1 Detailed Description

Contains a samle node update functor.

Definition in file sample_trie_node_update.hpp.

5.476 sample_update_policy.hpp File Reference

Classes

- struct __gnu_pbds::sample_update_policy

  A sample list-update policy.

Namespaces

- namespace __gnu_pbds

5.476.1 Detailed Description

Contains a sample policy for list update containers.

Definition in file sample_update_policy.hpp.

5.477 scoped_allocator File Reference

Classes

- class std::scoped_allocator_adaptor< _OuterAlloc, _InnerAllocs >
  Primary class template.

5.484.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file set_operations.h.

5.485 settings.h File Reference

Classes

- struct __gnu_parallel::_Settings

  class _Settings Run-time settings for the parallel mode including all tunable parameters.

Namespaces

- namespace __gnu_parallel

Macros

- #define _GLIBCXX_PARALLEL_CONDITION(__c)

5.485.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

5.485.2 parallelization_decision

The decision whether to run an algorithm in parallel.

There are several ways the user can switch on and __off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag gnu_parallel::sequential_tag() to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag
      ());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable __gnu_parallel::_Settings::algorithm_strategy is checked. _It is a tristate variable corresponding to:

a. force_sequential, meaning the sequential algorithm is executed. b. force_parallel, meaning the parallel algorithm is executed. c. heuristic

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(__s). The threshold can be set by the user, individually for each algorithm. The according variables are called gnu_parallel::_Settings::[algorithm]_minimal_n .

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

Definition in file settings.h.

5.485.3 Macro Definition Documentation

5.485.3.1 #define _GLIBCXX_PARALLEL_CONDITION(*__c*)

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

Parameters

__c	A condition that is convertible to bool that is overruled by __gnu_parallel::_Settings::algorithm_-strategy. Usually a decision based on the input size.

Definition at line 95 of file settings.h.

5.486 shared_ptr.h File Reference

Classes

- struct owner_less< _Tp >

  Primary template owner_less.
- class std::enable_shared_from_this< _Tp >

  Base class allowing use of member function shared_from_this.

5.487.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <memory>.

Definition in file shared_ptr_base.h.

5.488 size_fn_imps.hpp File Reference

5.488.1 Detailed Description

Contains implementations of cc_ht_map_'s entire container size related functions.

Definition in file size_fn_imps.hpp.

5.489 slice_array.h File Reference

Classes

- class std::slice

  Class defining one-dimensional subset of an array.
- class std::slice_array< _Tp >

  Reference to one-dimensional subset of an array.

Namespaces

- namespace std

Macros

- #define **_DEFINE_VALARRAY_OPERATOR**(_Op, _Name)

5.489.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <valarray>.

Definition in file slice_array.h.

5.490 slist File Reference

Classes

- class __gnu_cxx::slist< _Tp, _Alloc >

Namespaces

5.491.1 Detailed Description

Parallel sorting algorithm switch. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file sort.h.

5.492 splay_fn_imps.hpp File Reference

5.492.1 Detailed Description

Contains an implementation class for splay_tree_.

Definition in file splay_fn_imps.hpp.

5.493 splay_tree_.hpp File Reference

Classes

- class __gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
  Splay tree.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_ASSERT_BASE_NODE_CONSISTENT**(_Node)
- #define **PB_DS_CLASS_C_DEC**

- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_S_TREE_BASE**
- #define **PB_DS_S_TREE_BASE_NAME**
- #define **PB_DS_S_TREE_NAME**

5.493.1 Detailed Description

Contains an implementation class for splay trees.

Definition in file splay_tree_.hpp.

5.494 split_fn_imps.hpp File Reference

5.494.1 Detailed Description

Contains an implementation class for pat_trie.

Definition in file split_fn_imps.hpp.

5.495 split_join_fn_imps.hpp File Reference

5.495.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file binary_heap_/split_join_fn_imps.hpp.

5.496 split_join_fn_imps.hpp File Reference

5.496.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file binomial_heap_base_/split_join_fn_imps.hpp.

5.497 split_join_fn_imps.hpp File Reference

5.497.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file bin_search_tree_/split_join_fn_imps.hpp.

5.498 split_join_fn_imps.hpp File Reference

5.498.1 Detailed Description

Contains an implementation class for ov_tree_.

Definition in file ov_tree_map_/split_join_fn_imps.hpp.

5.499 split_join_fn_imps.hpp File Reference

5.499.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file pairing_heap_/split_join_fn_imps.hpp.

5.500 split_join_fn_imps.hpp File Reference

5.500.1 Detailed Description

Contains an implementation for rb_tree_.

Definition in file rb_tree_map_/split_join_fn_imps.hpp.

5.501 split_join_fn_imps.hpp File Reference

5.501.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

Definition in file rc_binomial_heap_/split_join_fn_imps.hpp.

5.502 split_join_fn_imps.hpp File Reference

5.502.1 Detailed Description

Contains an implementation class for splay_tree_.

Definition in file splay_tree_/split_join_fn_imps.hpp.

5.503 split_join_fn_imps.hpp File Reference

5.503.1 Detailed Description

Contains an implementation for thin_heap_.

Definition in file thin_heap_/split_join_fn_imps.hpp.

5.504 sso_string_base.h File Reference

Namespaces

- namespace __gnu_cxx

5.504.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ext/vstring.h>.

Definition in file sso_string_base.h.

5.505 sstream File Reference

Classes

- class std::basic_istringstream< _CharT, _Traits, _Alloc >

  Controlling input for std::string.
- class std::basic_ostringstream< _CharT, _Traits, _Alloc >

  Controlling output for std::string.
- class std::basic_stringbuf< _CharT, _Traits, _Alloc >

  The actual work of input and output (for std::string).
- class std::basic_stringstream< _CharT, _Traits, _Alloc >

  Controlling input and output for std::string.

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_SSTREAM**

5.505.1 Detailed Description

This is a Standard C++ Library header.

Definition in file sstream.

5.506 sstream.tcc File Reference

Namespaces

- namespace std

Macros

- #define **_SSTREAM_TCC**

5.506.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <sstream>.

Definition in file sstream.tcc.

5.507 stack File Reference

Macros

- #define **_GLIBCXX_STACK**

5.507.1 Detailed Description

This is a Standard C++ Library header.

Definition in file stack.

5.508 standard_policies.hpp File Reference

Classes

- struct __gnu_pbds::detail::default_comb_hash_fn

  Primary template, default_comb_hash_fn.
- struct __gnu_pbds::detail::default_eq_fn< Key >

  Primary template, default_eq_fn.
- struct __gnu_pbds::detail::default_hash_fn< Key >

  Primary template, default_hash_fn.
- struct __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >

  Primary template, default_probe_fn.
- struct __gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >

  Primary template, default_resize_policy.
- struct __gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >

  Partial specialization, default_trie_access_traits.
- struct __gnu_pbds::detail::default_update_policy

  Default update policy.
- struct default_trie_access_traits< Key >

  Primary template, default_trie_access_traits.

Namespaces

- namespace __gnu_pbds

Macros

- #define **__dtrie_alloc**
- #define **__dtrie_string**

Enumerations

- enum { **default_store_hash** }

5.508.1 Detailed Description

Contains standard policies for containers.

Definition in file standard_policies.hpp.

5.509 stdc++.h File Reference

5.509.1 Detailed Description

This is an implementation file for a precompiled header.

Definition in file stdc++.h.

5.510 stdexcept File Reference

Classes

- class std::domain_error
- class std::invalid_argument
- class std::length_error
- class std::logic_error

  One of two subclasses of exception.
- class std::out_of_range
- class std::overflow_error
- class std::range_error
- class std::runtime_error

  One of two subclasses of exception.
- class std::underflow_error

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_STDEXCEPT**

5.510.1 Detailed Description

This is a Standard C++ Library header.

Definition in file stdexcept.

5.511 stdio_filebuf.h File Reference

Classes

- class __gnu_cxx::stdio_filebuf< _CharT, _Traits >

  Provides a layer of compatibility for C/POSIX.
  This GNU extension provides extensions for working with standard C FILE∗'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., stdio_filebuf<char>.

Namespaces

- namespace __gnu_cxx

5.511.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file stdio_filebuf.h.

5.512 stdio_sync_filebuf.h File Reference

Classes

- class __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >

  Provides a layer of compatibility for C.
  This GNU extension provides extensions for working with standard C FILE∗'s. It must be instantiated by the user with the type of character used in the file stream, e.g., stdio_filebuf<char>.

Namespaces

- namespace __gnu_cxx

5.512.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file stdio_sync_filebuf.h.

5.513 stdtr1c++.h File Reference

5.513.1 Detailed Description

This is an implementation file for a precompiled header.

Definition in file stdtr1c++.h.

5.514 stl_algo.h File Reference

- template<typename _ForwardIterator , typename _Allocator >
  void **std::_Destroy** (_ForwardIterator __first, _ForwardIterator __last, _Allocator &__alloc)
- template<typename _ForwardIterator , typename _Tp >
  void **std::_Destroy** (_ForwardIterator __first, _ForwardIterator __last, allocator< _Tp > &)

5.517.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <memory>.

Definition in file stl_construct.h.

5.518 stl_deque.h File Reference

Classes

- class std::_Deque_base< _Tp, _Alloc >

- struct std::_Deque_iterator< _Tp, _Ref, _Ptr >

  A deque::iterator.
- class std::deque< _Tp, _Alloc >

  A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

Namespaces

- namespace std

Macros

- #define _GLIBCXX_DEQUE_BUF_SIZE

5.518.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <deque>.

Definition in file stl_deque.h.

5.518.2 Macro Definition Documentation

5.518.2.1 #define _GLIBCXX_DEQUE_BUF_SIZE

This function controls the size of memory nodes.

Parameters

__size	The size of an element.

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch _GLIBCXX_DEQUE_BUF_SIZE only if you know what you are doing, however: changing it breaks the binary compatibility!!

Definition at line 85 of file stl_deque.h.

- template<typename _Iterator >
  bool **std::operator>=** (const move_iterator< _Iterator > &__x, const move_iterator< _Iterator > &__y)

5.521.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.

This file implements reverse_iterator, back_insert_iterator, front_insert_iterator, insert_iterator, __normal_iterator, and their supporting functions and overloaded operators.

Definition in file stl_iterator.h.

5.522.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.

This file contains all of the general iterator-related utility functions, such as distance() and advance().

Definition in file stl_iterator_base_funcs.h.

5.523 stl_iterator_base_types.h File Reference

Classes

- class std::__has_iterator_category_helper< _Tp >

  Traits class for iterators.
- struct std::bidirectional_iterator_tag

  Bidirectional iterators support a superset of forward iterator operations.
- struct std::forward_iterator_tag

  Forward iterators support a superset of input iterator operations.
- struct std::input_iterator_tag

  Marking input iterators.
- struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >

  Common iterator class.
- struct std::iterator_traits< _Tp * >

  Partial specialization for pointer types.
- struct std::iterator_traits< const _Tp * >

  Partial specialization for const pointer types.
- struct std::output_iterator_tag

  Marking output iterators.
- struct std::random_access_iterator_tag

  Random-access iterators support a superset of bidirectional iterator operations.

Namespaces

- namespace std

Typedefs

- template<typename _InIter >
  using **std::_RequireInputIter** = typename enable_if< is_convertible< typename iterator_traits< _InIter >::iterator_category, input_iterator_tag >::value >::type

Functions

- template<typename _Iter >
  iterator_traits< _Iter >
  ::iterator_category std::__iterator_category (const _Iter &)

5.523.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.

This file contains all of the general iterator-related utility types, such as iterator_traits and struct iterator.

Definition in file stl_iterator_base_types.h.

5.524 stl_list.h File Reference

Classes

- struct std::__detail::_List_node_base

  Common part of a node in the list.
- class std::_List_base< _Tp, _Alloc >

  See bits/stl_deque.h's _Deque_base for an explanation.
- struct std::_List_const_iterator< _Tp >

  A list::const_iterator.
- struct std::_List_iterator< _Tp >

  A list::iterator.
- struct std::_List_node< _Tp >

  An actual node in the list.
- class std::list< _Tp, _Alloc >

  A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Namespaces

- namespace std
- namespace std::__detail

Functions

- namespace std

5.531.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <memory>.

Definition in file stl_raw_storage_iter.h.

5.532 stl_relops.h File Reference

Namespaces

- namespace std
- namespace std::rel_ops

Functions

- template<class _Tp >
  bool std::rel_ops::operator!= (const _Tp &__x, const _Tp &__y)
- template<class _Tp >
  bool std::rel_ops::operator<= (const _Tp &__x, const _Tp &__y)
- template<class _Tp >
  bool std::rel_ops::operator> (const _Tp &__x, const _Tp &__y)
- template<class _Tp >
  bool std::rel_ops::operator>= (const _Tp &__x, const _Tp &__y)

5.532.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <utility>.

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except std_utility.h. For more information, see the thread of about twenty messages starting with `http://gcc.gnu.org/ml/libstdc++/2001-01/msg00223.html`, or `http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous_overloads`

Short summary: the rel_ops operators should be avoided for the present.

Definition in file stl_relops.h.

5.545.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file string_conversions.h.

5.546 stringfwd.h File Reference

Classes

- struct std::allocator< _Tp >

  The standard allocator, as per [20.4].
- class std::basic_string< _CharT, _Traits, _Alloc >

  Managing sequences of characters and character-like objects.
- struct std::char_traits< _CharT >

  Basis for explicit traits specializations.

Namespaces

- namespace std

Typedefs

- typedef basic_string< char > std::string
- typedef basic_string< char16_t > std::u16string
- typedef basic_string< char32_t > std::u32string
- typedef basic_string< wchar_t > std::wstring

5.546.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <string>.

Definition in file stringfwd.h.

5.547 strstream File Reference

Namespaces

- namespace std

5.547.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <sstream>.

Definition in file strstream.

5.548 synth_access_traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::synth_access_traits< Type_Traits, Set, _ATraits >

  Synthetic element access traits.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_SYNTH_E_ACCESS_TRAITS_C_DEC**
- #define **PB_DS_SYNTH_E_ACCESS_TRAITS_T_DEC**

5.548.1 Detailed Description

Contains an implementation class for a patricia tree.

Definition in file synth_access_traits.hpp.

5.549 system_error File Reference

Classes

- class std::error_category

  error_category
- struct std::error_code

  error_code
- struct std::error_condition

  error_condition
- struct std::hash< error_code >

  std::hash specialization for error_code.
- struct std::is_error_code_enum< _Tp >

  is_error_code_enum

- struct std::is_error_condition_enum< _Tp >

    is_error_condition_enum
- class std::system_error

    Thrown to indicate error code of underlying system.

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_SYSTEM_ERROR**

Functions

- const error_category & **std::generic_category** () noexcept
- error_code **std::make_error_code** (errc __e) noexcept
- error_condition **std::make_error_condition** (errc __e) noexcept

- bool **std::operator==** (const error_condition &__lhs, const error_condition &__rhs) noexcept
- const error_category & **std::system_category** () noexcept

Variables

- error_code **std::make_error_code** (errc) noexcept
- error_condition **std::make_error_condition** (errc) noexcept

5.549.1 Detailed Description

This is a Standard C++ Library header.

Definition in file system_error.

5.550 tag_and_trait.hpp File Reference

Classes

- struct __gnu_pbds::associative_tag

  Basic associative-container.
- struct __gnu_pbds::basic_branch_tag

  Basic branch structure.
- struct __gnu_pbds::basic_hash_tag

  Basic hash structure.
- struct __gnu_pbds::basic_invalidation_guarantee
- struct __gnu_pbds::binary_heap_tag

  Binary-heap (array-based).
- struct __gnu_pbds::binomial_heap_tag

  Binomial-heap.
- struct __gnu_pbds::cc_hash_tag

  Collision-chaining hash.
- struct __gnu_pbds::container_tag

  Base data structure tag.
- struct __gnu_pbds::container_traits< Cntnr >

  Container traits.
- struct __gnu_pbds::container_traits_base< binary_heap_tag >

  Specialization, binary heap.
- struct __gnu_pbds::container_traits_base< binomial_heap_tag >

  Specialization, binomial heap.
- struct __gnu_pbds::container_traits_base< cc_hash_tag >

  Specialization, cc hash.
- struct __gnu_pbds::container_traits_base< gp_hash_tag >

  Specialization, gp hash.
- struct __gnu_pbds::container_traits_base< list_update_tag >

  Specialization, list update.
- struct __gnu_pbds::container_traits_base< ov_tree_tag >

  Specialization, ov tree.
- struct __gnu_pbds::container_traits_base< pairing_heap_tag >

  Specialization, pairing heap.
- struct __gnu_pbds::container_traits_base< pat_trie_tag >

  Specialization, pat trie.
- struct __gnu_pbds::container_traits_base< rb_tree_tag >

  Specialization, rb tree.
- struct __gnu_pbds::container_traits_base< rc_binomial_heap_tag >

  Specialization, rc binomial heap.
- struct __gnu_pbds::container_traits_base< splay_tree_tag >

  Specialization, splay tree.
- struct __gnu_pbds::container_traits_base< thin_heap_tag >

  Specialization, thin heap.
- struct __gnu_pbds::gp_hash_tag

  General-probing hash.
- struct __gnu_pbds::list_update_tag

List-update.

- struct __gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >

  A null node updator, indicating that no node updates are required.
- struct __gnu_pbds::null_type

  Represents no type, or absence of type, for template tricks.
- struct __gnu_pbds::ov_tree_tag

  Ordered-vector tree.
- struct __gnu_pbds::pairing_heap_tag

  Pairing-heap.
- struct __gnu_pbds::pat_trie_tag

  PATRICIA trie.
- struct __gnu_pbds::point_invalidation_guarantee
- struct __gnu_pbds::priority_queue_tag

  Basic priority-queue.
- struct __gnu_pbds::range_invalidation_guarantee
- struct __gnu_pbds::rb_tree_tag

  Red-black tree.
- struct __gnu_pbds::rc_binomial_heap_tag

  Redundant-counter binomial-heap.
- struct __gnu_pbds::sequence_tag

  Basic sequence.
- struct __gnu_pbds::splay_tree_tag

  Splay tree.
- struct __gnu_pbds::string_tag

  Basic string container, inclusive of strings, ropes, etc.
- struct __gnu_pbds::thin_heap_tag

  Thin heap.
- struct __gnu_pbds::tree_tag

  Basic tree structure.
- struct __gnu_pbds::trie_tag

  Basic trie structure.
- struct __gnu_pbds::trivial_iterator_tag

  A trivial iterator tag. Signifies that the iterators has none of std::iterators's movement abilities.
- struct container_base_dispatch< Key, Mapped, _Alloc, Tag, Policy_Tl >

  Dispatch mechanism, primary template for associative types.
- struct container_traits_base< _Tag >

  Primary template, container traits base.

Namespaces

- namespace __gnu_pbds

Typedefs

- typedef void __gnu_pbds::trivial_iterator_difference_type

5.550.1 Detailed Description

Contains tags and traits, e.g., ones describing underlying data structures.

Definition in file tag_and_trait.hpp.

5.551 tags.h File Reference

Classes

- struct __gnu_parallel::balanced_quicksort_tag

  Forces parallel sorting using balanced quicksort at compile time.
- struct __gnu_parallel::balanced_tag

  Recommends parallel execution using dynamic load-balancing at compile time.
- struct __gnu_parallel::constant_size_blocks_tag

  Selects the constant block size variant for std::find().
- struct __gnu_parallel::default_parallel_tag

  Recommends parallel execution using the default parallel algorithm.
- struct __gnu_parallel::equal_split_tag

  Selects the equal splitting variant for std::find().
- struct __gnu_parallel::exact_tag

  Forces parallel merging with exact splitting, at compile time.
- struct __gnu_parallel::find_tag

  Base class for for std::find() variants.
- struct __gnu_parallel::growing_blocks_tag

  Selects the growing block size variant for std::find().
- struct __gnu_parallel::multiway_mergesort_exact_tag

  Forces parallel sorting using multiway mergesort with exact splitting at compile time.
- struct __gnu_parallel::multiway_mergesort_sampling_tag

  Forces parallel sorting using multiway mergesort with splitting by sampling at compile time.
- struct __gnu_parallel::multiway_mergesort_tag

  Forces parallel sorting using multiway mergesort at compile time.
- struct __gnu_parallel::omp_loop_static_tag

  Recommends parallel execution using OpenMP static load-balancing at compile time.
- struct __gnu_parallel::omp_loop_tag

  Recommends parallel execution using OpenMP dynamic load-balancing at compile time.
- struct __gnu_parallel::parallel_tag

  Recommends parallel execution at compile time, optionally using a user-specified number of threads.
- struct __gnu_parallel::quicksort_tag

  Forces parallel sorting using unbalanced quicksort at compile time.
- struct __gnu_parallel::sampling_tag

  Forces parallel merging with exact splitting, at compile time.
- struct __gnu_parallel::sequential_tag

  Forces sequential execution at compile time.
- struct __gnu_parallel::unbalanced_tag

  Recommends parallel execution using static load-balancing at compile time.

Namespaces

- namespace __gnu_parallel

5.551.1 Detailed Description

Tags for compile-time selection. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file tags.h.

5.552 tgmath.h File Reference

Macros

- #define **_GLIBCXX_TGMATH_H**

5.552.1 Detailed Description

This is a Standard C++ Library header.

Definition in file tgmath.h.

5.553 thin_heap_.hpp File Reference

Classes

- class __gnu_pbds::detail::thin_heap< Value_Type, Cmp_Fn, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_ASSERT_AUX_NULL**(X)
- #define **PB_DS_ASSERT_NODE_CONSISTENT**(_Node, _Bool)
- #define **PB_DS_BASE_T_P**
- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

Enumerations

- enum { **num_distinct_rank_bounds** }

Variables

- static const std::size_t **__gnu_pbds::detail::g_a_rank_bounds** [num_distinct_rank_bounds]

5.553.1 Detailed Description

Contains an implementation class for a thin heap.

Definition in file thin_heap_.hpp.

5.554 thread File Reference

Classes

- struct std::hash< thread::id >

  std::hash specialization for thread::id.
- class std::thread

  thread
- class std::thread::id

  thread::id

Namespaces

- namespace std
- namespace std::this_thread

Macros

- #define **_GLIBCXX_THREAD**

Functions

- void **std::this_thread::__sleep_for** (chrono::seconds, chrono::nanoseconds)
- thread::id std::this_thread::get_id () noexcept
- bool **std::operator!=** (thread::id __x, thread::id __y) noexcept
- template<class _CharT , class _Traits >
  basic_ostream< _CharT, _Traits > & **std::operator<<** (basic_ostream< _CharT, _Traits > &__out, thread::id __id)
- bool **std::operator<=** (thread::id __x, thread::id __y) noexcept
- bool **std::operator>** (thread::id __x, thread::id __y) noexcept
- bool **std::operator>=** (thread::id __x, thread::id __y) noexcept
- template<typename _Rep , typename _Period >
  void std::this_thread::sleep_for (const chrono::duration< _Rep, _Period > &__rtime)
- template<typename _Clock , typename _Duration >
  void std::this_thread::sleep_until (const chrono::time_point< _Clock, _Duration > &__atime)
- void **std::swap** (thread &__x, thread &__y) noexcept
- void std::this_thread::yield () noexcept

5.554.1 Detailed Description

This is a Standard C++ Library header.

Definition in file thread.

5.555 throw_allocator.h File Reference

Classes

- struct __gnu_cxx::annotate_base

  Base class for checking address and label information about allocations. Create a std::map between the allocated address (void∗) and a datum for annotations, which are a pair of numbers corresponding to label and allocated size.
- struct __gnu_cxx::condition_base

  Base struct for condition policy.
- struct __gnu_cxx::forced_error

  Thown by exception safety machinery.
- struct __gnu_cxx::limit_condition

  Base class for incremental control and throw.
- struct __gnu_cxx::limit_condition::always_adjustor

  Always enter the condition.
- struct __gnu_cxx::limit_condition::limit_adjustor

  Enter the nth condition.
- struct __gnu_cxx::limit_condition::never_adjustor

  Never enter the condition.
- struct __gnu_cxx::random_condition

  Base class for random probability control and throw.
- struct __gnu_cxx::random_condition::always_adjustor

  Always enter the condition.
- struct __gnu_cxx::random_condition::group_adjustor

  Group condition.
- struct __gnu_cxx::random_condition::never_adjustor

  Never enter the condition.
- class __gnu_cxx::throw_allocator_base< _Tp, _Cond >

  Allocator class with logging and exception generation control. Intended to be used as an allocator_type in templatized code.
  Note: Deallocate not allowed to throw.
- struct __gnu_cxx::throw_allocator_limit< _Tp >

  Allocator throwing via limit condition.
- struct __gnu_cxx::throw_allocator_random< _Tp >

  Allocator throwing via random condition.
- struct __gnu_cxx::throw_value_base< _Cond >

  Class with exception generation control. Intended to be used as a value_type in templatized code.
- struct __gnu_cxx::throw_value_limit

  Type throwing via limit condition.
- struct __gnu_cxx::throw_value_random

  Type throwing via random condition.
- struct std::hash< __gnu_cxx::throw_value_limit >

  Explicit specialization of std::hash for __gnu_cxx::throw_value_limit.
- struct std::hash< __gnu_cxx::throw_value_random >

  Explicit specialization of std::hash for __gnu_cxx::throw_value_limit.

Namespaces

- namespace __gnu_cxx
- namespace std

Functions

- void **__gnu_cxx::__throw_forced_error** ()
- template<typename _Tp , typename _Cond >
  bool **__gnu_cxx::operator!=** (const throw_allocator_base< _Tp, _Cond > &, const throw_allocator_base< _Tp, _Cond > &)
- template<typename _Cond >
  throw_value_base< _Cond > **__gnu_cxx::operator*** (const throw_value_base< _Cond > &__a, const throw_value_base< _Cond > &__b)
- template<typename _Cond >
  throw_value_base< _Cond > **__gnu_cxx::operator+** (const throw_value_base< _Cond > &__a, const throw_value_base< _Cond > &__b)

  bool **__gnu_cxx::operator<** (const throw_value_base< _Cond > &__a, const throw_value_base< _Cond > &__b)
- std::ostream & **__gnu_cxx::operator<<** (std::ostream &os, const annotate_base &__b)
- template<typename _Cond >
  bool **__gnu_cxx::operator==** (const throw_value_base< _Cond > &__a, const throw_value_base< _Cond > &__b)
- template<typename _Tp , typename _Cond >
  bool **__gnu_cxx::operator==** (const throw_allocator_base< _Tp, _Cond > &, const throw_allocator_base< _Tp, _Cond > &)
- template<typename _Cond >
  void **__gnu_cxx::swap** (throw_value_base< _Cond > &__a, throw_value_base< _Cond > &__b)

5.555.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (throw_value, throw_allocator) intended to be used as value and allocator types while testing exception safety in templatized containers and algorithms. The allocator has additional log and debug features. The exception generated is of type forced_exception_error.

Definition in file throw_allocator.h.

5.556 time_members.h File Reference

Namespaces

- namespace std

5.556.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

Definition in file time_members.h.

5.557 trace_fn_imps.hpp File Reference

5.557.1 Detailed Description

Contains an implementation class for a binary_heap.

Definition in file binary_heap_/trace_fn_imps.hpp.

5.558 trace_fn_imps.hpp File Reference

5.558.1 Detailed Description

Contains implementations of cc_ht_map_'s trace-mode functions.

Definition in file cc_hash_table_map_/trace_fn_imps.hpp.

5.559 trace_fn_imps.hpp File Reference

5.559.1 Detailed Description

Contains implementations of gp_ht_map_'s trace-mode functions.

Definition in file gp_hash_table_map_/trace_fn_imps.hpp.

5.560 trace_fn_imps.hpp File Reference

5.560.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

Definition in file left_child_next_sibling_heap_/trace_fn_imps.hpp.

5.561 trace_fn_imps.hpp File Reference

5.561.1 Detailed Description

Contains implementations of lu_map_.

Definition in file list_update_map_/trace_fn_imps.hpp.

5.562 trace_fn_imps.hpp File Reference

5.562.1 Detailed Description

Contains an implementation class for pat_trie_.

Definition in file pat_trie_/trace_fn_imps.hpp.

5.563 trace_fn_imps.hpp File Reference

5.563.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

Definition in file rc_binomial_heap_/trace_fn_imps.hpp.

5.564 trace_fn_imps.hpp File Reference

5.564.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

Definition in file thin_heap_/trace_fn_imps.hpp.

5.565 traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::bin_search_tree_traits< Key, Mapped, Cmp_Fn, Node_Update, Node, _Alloc >

  Binary search tree traits, primary template.
- struct __gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >

  Specialization.

Namespaces

- namespace __gnu_pbds

5.565.1 Detailed Description

Contains an implementation for bin_search_tree_.

Definition in file bin_search_tree_/traits.hpp.

5.566 traits.hpp File Reference

Classes

- struct tree_traits< Key, Data, Cmp_Fn, Node_Update, Tag, _Alloc >

  Tree traits class, primary template.
- struct trie_traits< Key, Data, _ATraits, Node_Update, Tag, _Alloc >

  Trie traits class, primary template.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_DEBUG_VERIFY**(_Cond)

5.566.1 Detailed Description

Contains an implementation class for tree-like classes.

Definition in file branch_policy/traits.hpp.

5.567 traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >

  Tree traits.
- struct __gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >

  Specialization.

Namespaces

- namespace __gnu_pbds

5.567.1 Detailed Description

Contains an implementation class for ov_tree_.

Definition in file ov_tree_map_/traits.hpp.

5.568 traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >

  Specialization.

  Specialization.

Namespaces

- namespace __gnu_pbds

5.569.1 Detailed Description

Contains an implementation for rb_tree_.

Definition in file rb_tree_map_/traits.hpp.

5.570 traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >

  Specialization.
- struct __gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >

  Specialization.

Namespaces

- namespace __gnu_pbds

5.570.1 Detailed Description

Contains an implementation for splay_tree_.

Definition in file splay_tree_/traits.hpp.

5.571 tree_policy.hpp File Reference

Classes

- class __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >

  Functor updating ranks of entrees.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_BRANCH_POLICY_BASE**
- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

5.571.1 Detailed Description

Contains tree-related policies.

Definition in file tree_policy.hpp.

5.572 tree_trace_base.hpp File Reference

5.572.1 Detailed Description

Contains tree-related policies.

Definition in file tree_trace_base.hpp.

5.573 trie_policy.hpp File Reference

Classes

- class __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

  Functor updating ranks of entrees.
- class __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

  A node updator that allows tries to be searched for the range of values that match a certain prefix.
- struct __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >

Namespaces

- namespace __gnu_pbds

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_TRIE_POLICY_BASE**

5.573.1 Detailed Description

Contains trie-related policies.

Definition in file trie_policy.hpp.

5.574 trie_policy_base.hpp File Reference

Classes

- class __gnu_pbds::detail::trie_policy_base< Node_CItr, Node_Itr, _ATraits, _Alloc >

  Base class for trie policies.

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

5.574.1 Detailed Description

Contains an implementation of trie_policy_base.

Definition in file trie_policy_base.hpp.

5.575 trie_string_access_traits_imp.hpp File Reference

5.575.1 Detailed Description

Contains a policy for extracting character positions from a string for a vector-based PATRICIA tree

Definition in file trie_string_access_traits_imp.hpp.

5.576 tuple File Reference

Classes

- struct _Tuple_impl< _Idx, _Elements >
- struct std::_Tuple_impl< _Idx >
- struct std::_Tuple_impl< _Idx, _Head, _Tail...>
- class std::tuple< _Elements >

  Primary class template, tuple.
- class std::tuple< _T1, _T2 >

  Partial specialization, 2-element tuple. Includes construction and assignment from a pair.
- struct std::tuple_element< 0, tuple< _Head, _Tail...> >
- struct std::tuple_element< __i, tuple< _Head, _Tail...> >

- struct std::tuple_size< tuple< _Elements...> >

  class tuple_size
- struct std::uses_allocator< tuple< _Types...>, _Alloc >

  Partial specialization for tuples.
- struct tuple_element< __i, _Tp >

  Gives the type of the ith element of a given tuple type.
- struct tuple_size< _Tp >

  Finds the size of a given tuple type.

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_TUPLE**

  < bool, true > std::true_type

Functions

- template<typename _Tp >
  add_rvalue_reference< _Tp >::type std::declval () noexcept

5.577.1 Detailed Description

This is a Standard C++ Library header.

Definition in file type_traits.

5.577.2 Macro Definition Documentation

5.577.2.1 #define _GLIBCXX_HAS_NESTED_TYPE(*_NTYPE*)

Use SFINAE to determine if the type _Tp has a publicly-accessible member type _NTYPE.

Definition at line 2044 of file type_traits.

5.578 type_traits File Reference

Classes

- struct __reflection_typelist< _Elements >
- struct std::tr2::__reflection_typelist< _First, _Rest...>

  Partial specialization.
- struct std::tr2::__reflection_typelist<>

  Specialization for an empty typelist.
- struct std::tr2::bases< _Tp >

  Sequence abstraction metafunctions for manipulating a typelist.
- struct std::tr2::direct_bases< _Tp >

  Enumerate all the direct base classes of a class. Form of a typelist.

Namespaces

- namespace std
- namespace std::tr2

Macros

- #define **_GLIBCXX_TR2_TYPE_TRAITS**

5.578.1 Detailed Description

This is a TR2 C++ Library header.

Definition in file tr2/type_traits.

5.579 type_traits.h File Reference

Namespaces

- namespace __gnu_cxx

Functions

- template<typename _Type >
  bool **__gnu_cxx::__is_null_pointer** (_Type ∗__ptr)
- template<typename _Type >
  bool **__gnu_cxx::__is_null_pointer** (_Type)

5.579.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file type_traits.h.

5.580 type_utils.hpp File Reference

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_STATIC_ASSERT**(UNIQUE, E)

Typedefs

- typedef
  std::tr1::integral_constant
  < int, 0 > **__gnu_pbds::detail::false_type**
- typedef
  std::tr1::integral_constant
  < int, 1 > **__gnu_pbds::detail::true_type**

5.580.1 Detailed Description

Contains utilities for handnling types. All of these classes are based on Modern C++ by Andrei Alxandrescu.

Definition in file type_utils.hpp.

5.581 typeindex File Reference

Classes

- struct std::hash< type_index >

  std::hash specialization for type_index.
- struct std::type_index

  Class type_index
  The class type_index provides a simple wrapper for type_info which can be used as an index type in associative containers (23.6) and in unordered associative containers (23.7).

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_TYPEINDEX**

5.581.1 Detailed Description

This is a Standard C++ Library header.

Definition in file typeindex.

5.582 typeinfo File Reference

Classes

- class std::bad_cast

  Thrown during incorrect typecasting.
  If you attempt an invalid `dynamic_cast` *expression, an instance of this class (or something derived from this class) is thrown.*
- class std::bad_typeid

  Thrown when a NULL pointer in a `typeid` *expression is used.*
- class std::type_info

  Part of RTTI.

Namespaces

- namespace std

Macros

- #define **__GXX_MERGED_TYPEINFO_NAMES**
- #define **__GXX_TYPEINFO_EQUALITY_INLINE**
- #define **_TYPEINFO**

5.582.1 Detailed Description

This is a Standard C++ Library header.

Definition in file typeinfo.

5.583 typelist.h File Reference

Namespaces

- namespace __gnu_cxx

5.584.1 Detailed Description

Basic types and typedefs. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file types.h.

5.585 types_traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::no_throw_copies< Key, Mapped >

  Primary template.
- struct __gnu_pbds::detail::no_throw_copies< Key, null_type >

  Specialization.
- struct __gnu_pbds::detail::stored_data< _Tv, _Th >

  Primary template for representation of stored data. Two types of data can be stored: value and hash.
- struct __gnu_pbds::detail::stored_data< _Tv, null_type >

  Specialization for representation of stored data of just value type.
- struct __gnu_pbds::detail::stored_hash< _Th >

  Stored hash.
- struct __gnu_pbds::detail::stored_value< _Tv >

  Stored value.
- struct __gnu_pbds::detail::type_base< Key, Mapped, _Alloc, false >
- struct __gnu_pbds::detail::type_base< Key, Mapped, _Alloc, true >
- struct __gnu_pbds::detail::type_base< Key, null_type, _Alloc, false >
- struct __gnu_pbds::detail::type_base< Key, null_type, _Alloc, true >
- struct __gnu_pbds::detail::type_dispatch< Key, Mapped, _Alloc, Store_Hash >

  Type base dispatch.
- struct __gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >

  Traits for abstract types.
- struct type_base< Key, Mapped, _Alloc, Store_Hash >

  Primary template.

Namespaces

- namespace __gnu_pbds

5.585.1 Detailed Description

Contains a traits class of types used by containers.

Definition in file types_traits.hpp.

5.586 unique_copy.h File Reference

Namespaces

- namespace __gnu_parallel

Functions

- template<typename _IIter , class _OutputIterator , class _BinaryPredicate >
  _OutputIterator __gnu_parallel::__parallel_unique_copy (_IIter __first, _IIter __last, _OutputIterator __result, _BinaryPredicate __binary_pred)
- template<typename _IIter , class _OutputIterator >
  _OutputIterator __gnu_parallel::__parallel_unique_copy (_IIter __first, _IIter __last, _OutputIterator __result)

5.586.1 Detailed Description

Parallel implementations of std::unique_copy(). This file is a GNU parallel extension to the Standard C++ Library.

Definition in file unique_copy.h.

5.587 unique_ptr.h File Reference

Classes

- struct std::default_delete< _Tp >

  Primary template, default_delete.
- struct std::default_delete< _Tp[]>

  Specialization, default_delete.
- struct std::hash< unique_ptr< _Tp, _Dp > >

  std::hash specialization for unique_ptr.
- class std::unique_ptr< _Tp, _Dp >

  20.7.1.2 unique_ptr for single objects.
- class std::unique_ptr< _Tp[], _Dp >

  20.7.1.3 unique_ptr for array objects with a runtime length

Namespaces

5.594.1 Detailed Description

This file is a GNU profile extension to the Standard C++ Library.

Definition in file profile/unordered_set.

5.595 unordered_set.h File Reference

Classes

- class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >

  A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.
- class std::unordered_set< _Value, _Hash, _Pred, _Alloc >

  A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

5.599.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <valarray>.

Definition in file valarray_after.h.

5.611.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of work-stealing. Work stealing is described in

R. D. Blumofe and C. E. Leiserson. Scheduling multithreaded computations by work stealing. Journal of the ACM, 46(5):720–748, 1999.

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file workstealing.h.
